HANDBOOK OF ANALYTICAL CHEMISTRY

JULIUS LURIE

HANDBOOK OF ANALYTICAL CHEMISTRY

Contents

Preface

Handbook of Analytical Chemistry is intended for scientific workers, and chemistry students in universities, polytechnics, and technical colleges. It can be used in solving various problems (both calculating and experimental) concerning general chemistry, analytical chemistry, chemical technology, and so forth.

The tables of solubility products, of ionization constants of weak acids and bases, and of oxidation-reduction potentials have been drawn up according to recent data. When those tables were being drawn up, the following works were used: J. Bjerrum, G. Schwarzenbach, L. G. Sillén, *Stability Constants of Metal-ion Complexes, with Solubility Products of Inorganic Substances*, London, 1958; W. M. Latimer, *The Oxidation States of the Elements and Their Potentials in Aqueous Solutions*, N.Y., 1952; N. V. Axelrud and Ya. A. Fialkov, *Ukrainskii khimicheskii zhurnal*, 16, 75, 283, 296 (1950), and other articles from Soviet and foreign journals.

As we know, the results published by various authors concerning the determination of given quantities greatly differ from one another. It is therefore extremely difficult to select the "most probable" value of every constant. There is no international body to annually publish such "most probable" values of the given constants, as is done, for instance, by the International Commission concerning atomic weights. The selection I have made from numerous literary data is therefore inevitably subjective. I will be very grateful for information pointing out cases when this selection was made incorrectly, and will take account of such comments in the subsequent publications of the book.

The tables of the densities and concentrations of various acids and bases are drawn up for 20 °C.

The temperature values in all tables are given in degrees Celsius (°C).

Tables 22, 32, 33, 34B, 35, 39, 47, 48, 51-55 have been compiled by P. K. Agasyan, docent of the analytical chemistry department of the Moscow State University.

Instead of the ordinary table of five-place logarithms, a "simplified" table of five-place logarithms and antilogarithms is given at the end of the book. It takes up the same space as the tables of four-place logarithms, because instead of the real values of the differences between mantissas, their mean values are given for every line of the table. Errors that arise when using this table are not over 0.00002. The other tables in the handbook give exact values of the five-place mantissas of logarithms.

Ju.Ju. Lurie

Preliminary Remarks

The numerical expression of the results of weighings and other measurements, and the subsequent calculations with these numbers necessitate a strict observance of several rules.

Rule 1. *All numerical values, whether they are obtained directly by measurements or whether they are the derivatives of these measurements, must have a certain number of significant digits so that the last figure alone is questionable; the second-last figure must be accurate.*

For instance, the number 20.24 (ml), which expresses the reading of an ordinary burette, contains a proper number of figures, since figure 4 was obtained by an approximate (visual) estimate of the distance between the edge of the meniscus and the nearest scale division. Consequently, this figure is dubious: another observer could read the measurement of the burette as 20.23 or 20.25 ml. If upon measuring the solution by a burette, the lower boundary of the meniscus exactly touches the scale division showing 15 ml, the measurement result must be expressed by the number 15.00 (ml), since the observation error is not over 0.01-0.02 ml. Both zeroes in the number 15.00 (ml) will be significant digits. The zeroes standing at the beginning of the number before the first figure which is not a zero are not regarded as significant digits. Hence, the number expressing the mass of the filter ash 0.00004 (g) contains only one significant digit: 4.

If the mass is determined in grams and expressed by the number 23.4 (g) in which the last figure is inaccurate, in order to represent this mass in milligrams one must write not 23 400 mg, which would give a wrong idea about the accuracy of the weighing, but $234 \cdot 10^2$ mg, or $2.34 \cdot 10^4$ mg.

Rule 2. *When discarding the last figure if it is equal to or more than 5, the preceding figure must be increased by unity.*

Thus, in discarding the last figure in the number 16.236, we obtain 16.24.

Rule 3. *Upon addition (and subtraction) of several numbers, there will remain, as a result of calculation, a certain number of figures after the point that are in the addend with the least number of decimals.*

Rule 4. *Upon multiplication or division, the maximum relative error of the product or quotient cannot be less than the relative error in the least accurate number from the numbers taken.*

Relative errors are usually expressed in per cent: it is the ratio of the maximum possible error of the number to the number itself multiplied by 100.

If, for instance, it is necessary to multiply $0.0123 \cdot 24.62 \cdot 1.07461$ and if it is taken that the maximum absolute error in each of these numbers is not over unity in the last figure, then the corresponding relative errors will be:

$$\frac{1}{123}100 = 0.8\%$$

$$\frac{1}{2462}100 = 0.04\%$$

$$\frac{1}{107\,461}100 = 0.001\%$$

The first number has the greatest relative error (0.8%). It follows that the maximum relative error is not less than 0.8 per cent in the product as well. If the first three significant digits 0.325 are kept in the product, the last digit will already be inaccurate, since 0.8 per cent from 0.325 comes to about 0.003.

In cases when rule 1 is observed, i.e., when all numbers used in the calculation contain not more than one inaccurate figure, it is possible to apply the more simple (although less accurate) rule 4,a.

Rule 4,a. *Upon multiplication and division, as a result of calculation, it is necessary to keep a certain number of significant digits which are in the number having these digits least of all among the numbers used in the calculation.*

In the example given above, the first cofactor has three, the second has four, and the third has six significant digits. Consequently, we must leave in the product three significant digits and discard the rest; the result will be 0.325.

Rule 5. *In all the intermediate results, it is necessary to keep one figure more than is required by the preceding rules.* In the final result, this "reserve figure" is discarded.

Rule 6. *If some data have more decimals (upon addition and subtraction) or more significant digits (upon multiplication and division) than others, they must first be rounded, keeping one extra figure* (see rule 5).

Rule 7. *Upon multiplication and division with the aid of logarithms, it is sufficient to have as many figures in the mantissas as there are significant digits in the least accurate multiplier.*

Therefore, for most calculations, we can confine ourselves to the logarithmic table on page 448 of this book.

Together with an excessive as well as an unsubstantiated accuracy of calculations (a long series of figures after the decimal point, when already the first one of them is dubious, the use of multi-place logarithmic tables, and so forth), another error is very common: the unnecessary accuracy of individual measurements that leads to the finding of figures which in any case will be discarded upon subsequent calculations (if these calculations are made correctly).

Analytical chemists, for instance, have grown accustomed to making all weighings on an analytical balance with an accuracy of up to 0.0001 g, and they spent much time sitting by the balance, determining the correct figure in the fourth decimal. At the same time, this accuracy is often pointless. Here are a few examples:

1. Antimony is determined in red copper in which the Sb content is not more than 0.003%. For analysis, a portion of copper weighing 10 g is taken. With what accuracy must the copper shaving be weighed?

The result obtained must have not more than two significant digits, since copper containing even 0.0031% Sb must be discarded. Great accuracy is not needed, and in essence it is unattainable by the analytical methods used. Hence, the maximum absolute error in the final result is $\pm 0.0001\%$, which makes up $\pm 3.3\%$ of the maximum permissible Sb content in the metal. The calculation is made by the formula

$$x = \frac{a \cdot 100}{g}\ \%$$

where a = antimony content found;
g = weighed portion.

If a weighed portion of copper is taken with an accuracy of up to one-tenth of a gram (± 0.1 g), then with respect to the entire portion weighing 10 g, the relative error will be $\pm 1\%$, which is far less than $\pm 3.3\%$. In other words, if instead of 10 g of copper, 9.9 g or 10.1 g are weighed, then with a Sb content of 0.30 mg, this will give, in the first case, 0.00303% and, in the second case, 0.00297%, which in both cases will be rounded off to 0.0030%. It follows that a weighing can be made on technical scales with an accuracy of up to 0.1 g.

2. The accuracy of the colorimetric methods of analysis (if the optical density of solutions is measured visually and not photocolorimetrically or spectrophotometrically) is usually not over $\pm 5\%$ of the relative errors, while by some other methods, the relative error comes to $\pm 10\%$ and more. According to rule 4, the accuracy of the result cannot be higher than the accuracy of the least accurate measurement, and therefore, no matter how accurately a test is weighed for analysis, if this analysis ends with a colorimetric determination, the accuracy of the results will not be higher than the aforementioned $\pm 5\%$. It follows that if 1 g of a test is weighed with an accuracy of ± 0.01 g, i.e., with a maximum relative error of $\pm 1\%$, this accuracy is high enough.

Visual colorimetric methods are used only to determine the components contained in very small amounts in the substance being analysed, when a great relative error is permissible in the result obtained. The determination of iron in iron ore by the visual colorimetric method leads to impermissible errors.

Note. It must not be assumed that, in determining small amounts, the colorimetric methods of analysis are less accurate than other methods. On the contrary, if in the preceding example Sb is determined not by the colorimetric method (as is usually done), but by the gravimetric method, we would have to weigh about 0.0003 g of Sb_2O_4, which on an ordinary analytical balance can scarcely be made with a maximum error less than $\pm 30\%$ of the relative errors. In addition, no account is taken of the inevitable significant error due to impurities present in the calcined precipitate, an error which cannot be eliminated even when a microbalance is used.

3. In the calculation of the results of volumetric-analytical determinations, the least accurate figure is the number of millilitres of a titrating solution used for titration. Since the hundredth parts of a millilitre are marked approximately, it can be accepted that the maximum measurement error is not less than ±0.02 ml. The error due to the remaining residue is also ±0.02 ml. Therefore, the overall error can be as much as 0.04 ml*. With the total expenditure of 20 ml of the titrating solution, this will come to 0.2% of the relative errors. It follows that, taking 1 g for analysis, the weighing can be performed with an accuracy of up to 1 mg. This gives a relative error of ±0.5 mg, or 0.05%. If less than 20 ml of the titrating solution are used for titration, less accuracy is needed in taking a weighed portion.

On the other hand, the weighing of a starting substance for *establishing the titre* must be performed with an accuracy of up to unity in the fourth decimal, since in this case a portion weighing only about 0.2 g is taken and about 40 ml of the titrating solution are used for titration.

If one wishes to increase the accuracy of the volumetric-analytical methods, one must use gravimetric burettes instead of ordinary ones,** which completely precludes errors due to inaccurate measurement, remaining residue and a difference in temperature. The weighing of a sample now becomes a less accurate operation, and it should be performed with a relative error which is determined by the accuracy required in the final result (±0.01% and less).

The foregoing should not lead to the conclusion that the weighed portion can always be taken with an accuracy of ±1 mg or less. On the contrary, there are some analytical operations when the entire accuracy of an analytical balance must be used, and when even the accuracy of a microbalance is not high enough. Here are two examples.

4. Red electrolytic copper must contain 99.95% of Cu. The analytical determination of Cu in this case is made by electrolysis. What accuracy must the weighing be made with?

The error in the final result, expressed in per cent, must not be more than ±0.004%. It is apparently necessary to have no lesser accuracy in weighing a test of red copper as in weighing a platinum electrode before and after Cu is deposited on it. If one gram of a test is taken for an analysis, then, with the maximum accuracy of the weighing on an analytical balance being ±0.2 mg, the relative error will be ±0.02%, which is far more than is permissible. Therefore, in the given case, it is necessary to use a balance that is more accurate than the ordinary analytical one, or (as is usually done) to take not less than 5 g of the substance being analysed.

5. Suppose that for determining Zn in a copper-zinc alloy containing about 20% of Zn, a portion weighing 0.02 g is taken, whether owing to the small amount of shavings which an analyst has or with due regard to some advantages in the techniques of working with small amounts of a substance. The analysis is concluded by weighing

* See I. M. Koltgof and E. B. Sendel, *Kolichestvennyi analiz* (*Quantitative Analysis*), Moscow, 1948, p. 459.

** See, for instance, I. M. Koltgof and E. B. Sendel, *Kolichėstvennyi analiz* (*Quantitative Analysis*), Moscow, 1948, p. 561; I. M. Koltgof and V. A. Stenger, *Ob'emnyi analiz* (*Volumetric Analysis*), Vol. II, Moscow, 1952, p. 25.

the precipitate in the form of $Zn_2P_2O_7$. What accuracy must the weighing be made with?

The result of the analysis must be expressed with an accuracy of up to a hundredth part of a per cent (for instance, 19.84%), i.e., with a permissible error of $\pm 0.01\%$ of the absolute errors; since the Zn content is 20%, this will come to $\pm 0.05\%$ of the relative errors. The same accuracy must be obtained when weighing the portion of shavings and the calcined precipitate $Zn_2P_2O_7$. When a portion weighs 20 mg, the value $\pm 0.05\%$ comes to ± 0.01 mg; the same percentage of the mass of the calcined precipitate (~ 8 mg) is still less, being about ± 0.004 mg. A microchemical balance gives an error of about ± 0.01 mg. It follows that, in the given case, the weighing performed even with a microchemical balance does not ensure the required accuracy.

Table 1

Atomic Weights of the Elements

The atomic weights of various elements are determined with different accuracy which is expressed by a different number of figures after the decimal point. When the number expressing atomic weight ends with one or several zeroes, the latter are significant digits showing the accuracy with which the atomic weight of the corresponding element is determined (see rule 1, p. 11).

The results of chemical analyses must not be expressed with a precision greater than that of the atomic weight. This limitation must be especially reckoned with when determining some platinum and rare-earth elements, and also rhenium.

The table contains relative atomic weights published by the Commission on Atomic Weights of the International Union of Pure and Applied Chemistry (IUPAC) in 1965.

The Commission adopted a resolution whereby the old "oxygen chemical unit" of atomic weights (1/16 of the average atomic weight of the natural isotopic mixture of oxygen atoms) is replaced by the "carbon physical unit" (1/12 of the atomic mass of the carbon isotope ^{12}C).

For all the elements, besides those given below, the number expressing the atomic weight is given with an error not exceeding ± 0.5 in the last digit after the decimal point. The deviations of the atomic weight values for the given six elements are as follows: boron ± 0.003; hydrogen ± 0.00001; oxygen ± 0.0001; silicon ± 0.001; sulphur ± 0.003; carbon ± 0.00005. These deviations are due to variations in the natural isotopic composition of the elements.

Owing to the experimental inaccuracies in the determination of the atomic weights of the six elements listed below, their values deviate within the following limits: bromine ± 0.001; iron ± 0.003; copper ± 0.001; silver ± 0.001; chlorine ± 0.001; chromium ± 0.001.

The atomic weights of radioactive elements are given only for thorium and uranium; for other radioactive elements, the mass number of the isotope with the longest half-life is given in square brackets.

Element	Symbol	Atomic number	Atomic weight, a	log a

Table 4

Ionization Potentials of Atoms and Ions

The ionization potential is the minimum voltage of the electric field needed for tearing away one electron from an atom or ion.

The table gives the potentials of the ionization of atoms and ions, i.e., the potentials required for separating one electron from a neutral unexcited atom ($X - e \to X^+$) and the potentials required for tearing away one electron from a single-charge (positive) unexcited ion ($X^+ - e \to X^{2+}$), from a two-charge unexcited ion ($X^{2+} - e \to X^{3+}$) and so forth.

Insufficiently reliable data are given in parentheses.

Element	$X-e\to X^+$	$X^+-e\to X^{2+}$	$X^{2+}-e\to X^{3+}$	$X^{3+}-e\to X^{4+}$	$X^{4+}-e\to X^{5+}$	$X^{5+}-e\to X^{6+}$

Table 6

Atomic Weights, Molecular Weights*, Weights of Atomic Groups, and Their Logarithms

In compiling this table, all additions of atomic weights have been made in conformity with rules 2 and 3 (p. 11), the needless decimals having been discarded.

The atomic weights of all elements (apart from the 12 elements given below) are expressed in numbers in which errors are within the limits of ± 0.5 in the last figure.

When a fractional part of an atomic weight is being found, the error in its magnitude apparently passes over to the next decimal, which now becomes the first of dubious figures. The total number of figures after the decimal point thus increases by unity. If, for instance, the atomic weight of titanium (Ti) is 47.90, then one-half of this atomic weight (1/2 Ti) will be not 23.95, but 23.950; Sn = 118.69, 1/2 Sn = 59.345.

When a multiple of an atomic weight is being found, the error increases. If, for instance, it is necessary to increase the atomic weight 10 times, its value must be rounded off by reducing the number of figures after the decimal point by one figure. For example, the atomic weight of nitrogen (N) is 14.0067; while 10 N is not 140.067, but 140.07.

The multiplication of the atomic weight of iron only by 2 gives an error within the limits of ± 0.006 and, consequently, an error can be made in the preceding figure; therefore, if Fe = 55.847, then 2 Fe will be not 111.694, but 111.69. When dividing the atomic weight of iron by 3, we have the maximum error within the limits of ± 0.0001 and, consequently, the number of figures after the decimal point will not increase: 1/3 Fe = 18.615.

One must be guided by such considerations also when adding the atomic weights of various elements: if the sum of the maximum possible errors is either equal to or more than ± 5 in the last figure, a rounding must be made by reducing the number of figures after the decimal point by unity.

Formula	Weight, *a*	log *a*
Ag	107.868	03 289
2Ag	215.736	33 392
3Ag	323.604	51 001

Table 7

Analytical and Stoichiometric Multipliers (Factors)*

If g is the weighed portion of a substance taken for an analysis, a is the mass of a dried or calcined precipitate (gravimetric form) and f is the multiplier found in the given table, then the percentage of the unknown substance can be found according to the formula:

$$x = \frac{a \cdot f \cdot 100}{g} \%, \qquad \log x = \log a + \log f + 2 - \log g$$

where a and g are expressed in the same units.

Calculations must be made by discarding the characteristics of logarithms and leaving only the mantissas. Then, every calculation is reduced to the addition of three numbers

$$\log a + \log f + (1 - \log g)$$

In this table, the multipliers and their logarithms occasionally do not exactly conform to one another because the multipliers are rounded, while the logarithms of the multipliers—the intermediate stage of calculations—are given in more accurate numbers.

Substance being determined	Weighed portion	Multiplier, f	$\log f$
Ag	AgBr	0.5745	75 926

Table 8

Solubilities of Inorganic and Some Organic Compounds

The table shows the number of grams (P) of an anhydrous substance, given in the second column, which is dissolved in 100 g of water at a temperature indicated in the upper line of the table. When expressing these data in weight percentage ($P_1\%$), i.e., in grams of an anhydrous substance contained in 100 g of a saturated solution, the calculation is made by the formula $P_1 = \frac{P \cdot 100}{100+P}$.

S.Ph. stands for solid phase, i.e., a crystallohydrate which is in an equilibrium with a saturated solution. The third column gives the number of water molecules in a crystallohydrate (S.Ph.) which is in an equilibrium with a saturated solution. If the solubilities of two or more crystallohydrates of the same substance are given for the same temperature (for instance, at 0 °C the solubility of $Na_2SO_4 \cdot 10H_2O$

in Water

is 5.0 g per 100 g, and the solubility of $Na_2SO_4 \cdot 7H_2O$ is 19.5 g per 100 g), then the crystallohydrate having the poorest solubility will be in a *stable* equilibrium with the saturated solution, and the other crystallohydrates in a *metastable* equilibrium.

The solubility values of sparingly soluble salts are estimated by their solubility products (see Table 10).

In the table, the substances are arranged in the alphabetical order of the elements included in the formula which is written in the most common way. This must be taken into account when looking in the table for acid, base, double and complex salts whose formulas are occasionally written differently.

The solubilities of gases are given at a pressure of 760 mm Hg.

Table 10

Solubility Products of the Chief Sparingly Soluble Substances

The solubility product (SP) of substance Ct_mAn_n, which breaks up into ions according to the equation

$$Ct_mAn_n \rightleftarrows mCt + nAn$$

is $SP = a_{Ct}^m \cdot a_{An}^n$, where a_{Ct} is the activity of cation Ct, and a_{An} is the activity of anion An. The indicator of the solubility product pSP is the logarithm of the solubility product taken with an inverse sign.

When calculating the solubility of a sparingly soluble salt in water or in a solution of other salts by the value of the solubility product, account must be taken of: (1) the reaction of cations being formed with the hydroxyl ions of water; (2) the reaction of anions being formed with hydrogen ions; (3) the ionic strength of a solution on which the activity coefficients depend, and in some cases also (4) the potentialities of complex-ion formation. The ways of making such calculations are described in the textbooks of analytical chemistry.

In addition, *account must be taken of the presence, in the solution, of non-dissociated molecules of a dissolved salt whose concentrations are found by dividing the SP by the corresponding value of K* (Table 38; figures marked with an asterisk).

Formula of substance	SP	pSP=−log SP
$Ac(C_2O_4)_3$	2×10^{-24}	23.7
$Ac(OH)_3$	1×10^{-15}	15

* The solubility products of mercuric salts (with the exception of HgS and HgSe) are not given here, since their very small values can give rise to incorrect ideas about the correspondingly sparing solubilities of these salts. In fact, upon a transition of mercuric salts to a solution, a very small amount of free ions (the product of whose concentrations gives the value of SP) but a relatively great amount of non-dissociated molecules — $Hg(CN)_2$, $HgCl_2$, etc. — are formed.

The degree of dissociation of mercuric salts must be determined according to the constants given in Table 38.

* The values of SP_{MnS} are given according to A. Ringbom, "Solubilities of Sulfides" (*Report to Analytical Section IUPAC*, July, 1953); they considerably differ from many of those found earlier, for example for the modification of flesh-coloured: 7×10^{-16} (Bruner, Zawadski), 1.1×10^{-15} (Kapustinsky); for the modification of green colour: 6.2×10^{-22} (Bruner, Zawadski).

Table 12

Activity Coefficients of Various Ions at High Values of the Ionic Strength of a Solution

(Approximate Values)

The table has been compiled by L. Meites* according to the Davis formula:

$$-\frac{\log f_i}{Z_i^2} = \frac{0.511\sqrt{\mu}}{1+1.5\sqrt{\mu}} - 0.2\mu$$

where μ is the ionic strength of a solution, f_i is the activity coefficient of an ion, Z_i is an ion charge (from 1 to 6). A mean value of ion radii was taken as an effective ion radius.

μ	$-\frac{\log f_i}{Z_i^2}$	f_i at Z_i equal to					
		1	2	3	4	5	6

* L. Meites, *Handbook of Analytical Chemistry*, London, 1963.

Table 13

Calibration of Glassware

Correction A is equal to the difference between 1000 g (mass of one litre of water in a vacuum at 4 °C) and the mass of one litre of water in a vacuum at a temperature indicated in the first column.

Correction B for weighing in air with the aid of brass weights (the density of brass is 8.4 g/cm^3) is calculated with an allowance that barometric pressure differs little from the standard one (760 mm Hg) and that the relative humidity of air is about 50%. Since with a change in barometric pressure by 10 mm Hg the value of B changes on average by 14 mg, it is necessary, if pressure deviates greatly from 760 mm, to use a more accurate value $B' = B + (P - 760)\ 1.4$ mg, where P is the barometric pressure.

Correction C for the expansion (or compression) of a vessel depending on whether the temperature is above or below the standard one (20 °C) is calculated according to the mean expansion coefficient of glass, equal to 25×10^{-6}.

The last column gives the mass of water in air at experiment temperature occupying at 20 °C a volume of one litre. *When calibrating vessels with a smaller capacity, one should take the corresponding part of this mass.*

Table 14

Calculation of the Results of Volumetric-Analytical Determinations*

One millilitre of a titrating solution titrates $N_s E_x$ mg of a substance being determined (N_s is the normality of the titrating solution**, E_x is the equivalent weight of the substance being determined that is given in the table). If g is the weighed portion of the material being analysed in mg and V is the amount of the titrating solution used in titration, then the percentage of substance x being determined is:

$$x = \frac{V N_s E_x \cdot 100}{g}$$

A. Acid-Base Titrations (Acidimetry and Alkalimetry)

Substances used for titration and the concentrations of their normal solutions:

(a) *Acids*

Formula	HCl	H_2SO_4	HNO_3	$H_2C_2O_4 \cdot 2H_2O$
Concentration of 1N solutions (g/l) . .	36.461	49.039	63.0129	63.0333

(b) *Alkalies*

Formula	$NaOH$	KOH	$Ba(OH)_2 \cdot 8H_2O$
Concentration of 1N solutions (g/l)	39.9972	56.109	157.74

Substance being determined	$\frac{E}{M*}$	Equivalent weight, E	log E
Al	1/3	8.99383	95 394
B (titration of H_3BO_3 with phenolphthalein in the presence of mannitol or glycerin)	1	10.811	03 387
$Ba(OH)_2$	1/2	85.675	93 285
$Ba(OH)_2 \cdot 8H_2O$	1/2	157.74	19 794
CO_2	1/2	22.0050	34 252
CO_3	1/2	30.0047	47 719
CH_3COO^-	1	59.0450	77 118

* M=molecular weight.

* For the use of the table, see p. 462.

** In the notation N_s, E_x, etc., given here and in the following tables, symbol s, written as a subscript, applies to the titrating solutions, and symbol x applies to the titrates of a substance being determined.

Table 14 (continued)

Substance being determined	$\frac{E}{M}$	Equivalent weight, E	log E
$CaCO_3$	1/2	50.045	69 936
$Ca(HCO_3)_2$	1/2	81.057	90 879
CaO	1/2	28.040	44 778
$Ca(OH)_2$	1/2	37.047	56 875

$Na_2CO_3 \cdot 10H_2O$	1/2	143.071	15 555
$NaHCO_3$	1	84.0071	92 432
NaOH	1	39.9972	60 203
P (titration of phosphoromolybdate precipitate)	1/23	1.3467	12 927
PO_4^{3-} (titration of phosphoromolybdate precipitate)	1/23	4.1292	61 587

B. Oxidation-Reduction Methods (Manganatometry, Chromatometry, Iodometry, Bromatometry, Ceriometry, etc.)

Substances used for titration and the concentrations of their normal solutions:

(a) *Oxidizing Agents*

Formula	$KMnO_4$	$Co(NH_4)_4(SO_4)_4 \cdot 2H_2O$	$Co(SO_4)_2 \cdot 4H_2O$
Concentration of 1N solution (g/l)	31.6075	632.55	404.30

Table 14 (continued)

Formula	I_2	$KBrO_3$	$K_2Cr_2O_7$
Concentration of 1*N* solution (g/l)	126.9044	27.835	49.032
Formula	KIO_3	$Ca(ClO)_2$	NH_4VO_3
Concentration of 1*N* solution (g/l)	35.6674	35.745	116.979

(b) *Reducing Agents*

Formula	$Na_2S_2O_3\cdot 5H_2O$	$Fe(NH_4)_2(SO_4)_2\cdot 6H_2O$	$FeSO_4\cdot 7H_2O$
Concentration of 1*N* solution (g/l)	248.18	392.14 —	278.02
Formula	$C_6H_8O_6$ (ascorbic acid)	$Hg_2(NO_3)_2\cdot 2H_2O$	
Concentration of 1*N* solution (g/l)	88.064	280.61	

Substance being determined	$\frac{E}{M}$	Equivalent weight, *E*	log *E*
Al (after precipitation with hydroxyquinoline)	1/12	2.24846	35 189
As ($As^{3+} \rightleftarrows As^{5+}$)	1/2	37.46080	57 358

** RE: rare-earth elements (lanthanoids, Y and Sc).

Table 16

Calculation of the Results of Gas and Gasometric Analyses*

If an analysis of a substance is reduced to the preparation of a certain gas whose volume is measured, then, for further estimates, this volume must be brought to standard conditions, i.e., to a temperature of 0 °C and a pressure of 760 mm Hg.

Here, three cases are possible:

1. Gas collected dry over mercury

In this case the gas volume under standard conditions (V_0) is found by the approximate but sufficiently accurate formula:

$$V_0 = V \frac{P_0}{(1+\alpha t)\,760} = V$$

where V = measured gas volume;
t = gas temperature;
α = 0.003670;
P_0 = barometer reading brought to 0 °C.

$$F = \frac{P_0}{(1+\alpha t)\,760}$$

Value P_0 is found by the formula:

$$P_0 = \left(P_t - \frac{1}{8}\,t'\right) \text{ mm Hg}$$

where P_t = barometer reading;
t' = temperature of mercury in the barometer (the temperature of the air around the barometer is measured).

$$\log V_0 = \log V + \log F$$

The values of $\log F$ for various values of t and P_0 are given in Table 16,A.

2. Gas collected over water

In this case a correction for mercury temperature must be made in the barometer reading and water vapour pressure at temperature t must be deducted:

$$P_0 = P_t - \frac{1}{8}\,t' - P_B$$

where P_B is the water vapour pressure at the corresponding temperature of gas over water; it is given in section B of this table.

* For the use of the table, see p. 468.

Table 16 (continued)

3. *Gas collected over* KOH *solution or over a saturated* NaCl *solution*

In this case the value of water vapour pressure over the corresponding absorbing aqueous solution must be deducted from the value of P_t:

$$P_0 = P_t - \frac{1}{8}t' - P_B$$

The values of P_B for aqueous solutions are given in Table 16,B.

If the collected gas is the component whose content is determined in the substance being analysed, then, to find the mass of this gas, the found volume V_0 must obviously be multiplied by the density ρ of this gas under standard conditions; hence, the percentage (x) of the unknown component is:

$$x = \frac{V_0 \times \rho \times 100}{g}$$

where g is the weighed portion of the substance being analysed.

The corresponding values of the mass of one litre of gas in grams or of one millilitre of gas in milligrams and their logarithms are given in Table 16,B.

But if, according to the mass of collected gas, a calculation is made of the percentage of a certain component of a substance which is being analysed and from which this gas is separated, then the mass found must be multiplied by the value of f'. Table 16,D gives the values of f', which are the product of the conversion factor and gas density.

The conversion factor is estimated on the basis of the reaction as a result of which the gas being measured is obtained. Thus, in determining Al according to the amount of liberated H_2, we find that three H atoms are formed per Al atom:

$$f' = \frac{a_{Al}}{(3a_H)(\rho_H)} + \frac{a_{Al}\rho_H}{3a_H} = \frac{26.982 \times 0.08988}{3 \times 1.0080} = 0.8020$$

where a_{Al} = atomic weight of Al;
a_H = atomic weight of H;
ρ_H = density of H_2 according to Table 16,C.

Thus, the percentage of the unknown compound (x) is found by the formula:

$$x = \frac{V_0 f' \times 100}{g}$$

or

$$x = \frac{VFf' \times 100}{g}$$

Table 16 (continued)

Ni	Nickel	H_2	2.6175	41 789
Na_2O_2	Sodium peroxide	O_2	6.965	84 291
Zn	Zinc	H_2	2.9145	46 456

Table 17

Conversion Formulas for Solution Concentrations

Notation: d = density of a solution, g/ml; M_w = molecular weight of a solute; E = equivalent weight of a solute

Concentration	A	B	C	N	M	L
In per cent (g per 100 g of a solution, wt. %), $A =$	A	$\frac{100B}{100+B}$	$\frac{C}{10d}$	$\frac{NE}{10d}$	$\frac{MM_w}{10d}$	$\frac{100LM_w}{1000+LM_w}$
In grams of a solute per 100 g of a solvent, $B =$	$\frac{100A}{100-A}$	B	$\frac{100C}{1000d-C}$	$\frac{100NE}{1000d-NE}$	$\frac{100MM_w}{1000d-MM_w}$	$\frac{LM_w}{10}$
In grams per litre of a solution (g/l), $C =$	$10Ad$	$\frac{1000Bd}{100+B}$	C	NE	MM_w	$\frac{1000LM_wd}{1000+LM_w}$
Normal, $N =$	$\frac{10Ad}{E}$	$\frac{1000Bd}{(100+B)E}$	$\frac{C}{E}$	N	$\frac{MM_w}{E}$	$\frac{1000LM_w}{(1000+LM_w)E}$
Molar, $M =$	$\frac{10Ad}{M_w}$	$\frac{1000Bd}{(100+B)M_w}$	$\frac{C}{M_w}$	$\frac{NE}{M_w}$	M	$\frac{1000Ld}{1000+M_wL}$
Molal (number of moles of a solute per 1000 g of a solvent), $L =$	$\frac{1000A}{(100-A)M_w}$	$\frac{10B}{M_w}$	$\frac{1000C}{(1000d-C)M_w}$	$\frac{1000NE}{(1000d-NE)M_w}$	$\frac{1000M}{1000d-MM_w}$	L

1.040	31.6	5.46	1.050	99.9	17.5
1.045	36.2	6.30			

** Acetic acid, in the given limits of concentration, has a density of 1.0700 g/cm^3 with deviations of less than 0.0001. Since density decreases with a further increase in concentration, then in order to determine the concentration from two possible ones that meets the density found (for example, the density of the solution is 1.060 g/cm^3; will its concentration be 53.4% or 95.4%?), a little water is added to the acetic acid test. If the density decreases, a lower concentration is taken (in the given case, 53.4%), and if it increases, a higher concentration is taken (in the given case, 95.4%).

G. Densities and Concentrations of Potassium Hydroxide Solutions*

Density at 20 °C, g/cm^3	KOH concentration		Density at 20 °C, g/cm^3	KOH concentration	
	g per 100 g of solution (wt. %)	mole/l		g per 100 g of solution (wt. %)	mole/l
1.000	0.197	0.0351	1.015	1.84	0.333
1.005	0.743	0.133	1.020	2.38	0.433_5
1.010	1.29_5	0.233	1.025	2.93	0.536

* For the use of the table, see p. 470.

K. Densities and Concentrations of Selected Commercial Reagents

Reagent	Density at 20°C, g/cm^3	Concentration	
		wt. %	mole/l
Acetic acid, analytical grade and pure	$\leqslant$1.0549	$\geqslant$98	$\geqslant$17.21
Acetic acid, glacial, chemically pure	$\leqslant$1.0503	$\geqslant$99.8	$\geqslant$17.45
Ammonia solution, concentrated	0.901-0.907	25.0-27.0	13.32-14.28
Hydrobromic acid	1.486	46.85	8.6
Hydrochloric acid	1.174-1.185	35.0-38.0	11.27-12.38
Hydrofluoric acid, analytical grade	$\geqslant$1.128	$\geqslant$40	$\geqslant$22.55
Hydrofluoric acid, pure	$\geqslant$1.116	$\geqslant$35	$\geqslant$19.52
Hydroiodic acid	1.50-1.55	45.3-45.8	5.31-5.55
Nitric acid, "strong" . .	1.372-1.405	60.7-68.0	13.28-15.16
Nitric acid, "weak" . . .	1.337-1.367	54.0-60.0	11.41-13.02

Table 18 (continued)

Reagent	Density at 20°C, g/cm³	Concentration	
		wt. %	mole/l
Perchloric acid	1.206-1.220	30.0-31.61	3.60-3.84
Phosphoric acid, analytical grade	$\geqslant$1.719	$\geqslant$88	$\geqslant$15.43
Phosphoric acid, pure . .	$\geqslant$1.713	$\geqslant$87.5	$\geqslant$15.29
Sulphuric acid	1.83-1.835	93.56-95.60	17.46-17.88

Table 19

Chief Acid-Base Indicators*

(in the order of the growth in the pH range)

No.	Indicator	Formula	Concentration, %	Solvent	pH range and the indicator colour
1	Methyl violet; first change (see Nos. 7 and 15)	 (predominantly)	0.1 and 0.05	Water	0.13-0.5 yellow—green
2	α-Naphtholbenzoin; first change (see No. 57)		0.05	70% alcohol	0.0-1.0 green—yellow

3	Picric acid (2,4,6-trinitrophenol)		0.1	Water	0.0-1.3 colourless—yellow
4	Methyl green		0.05	Water	0.1-2.0 yellow—green-blue
5	Cresol red (*o*-cresolsulphophthalein); first change		0.04	50% alcohol	0.2-1.8 red—yellow

*For the use of the table, see p. 472.

Table 19 (continued)

No.	Indicator	Formula	Concentration, %	Solvent	pH range and the indicator colour
6	Malachite green; first change (see No. 69)		0.1	Water	0.13-2.0 yellow—bluish green
7	Methyl violet (see Nos. 1 and 15; second change)	*See* No. 1	0.1	Water	1.0-1.5 green—blue
8	Metanil yellow (victoria yellow, tropeolin G)		0.1	Water	1.2-2.3 red—yellow
9	Benzene azodiphenylamine		0.01	50% alcohol with an addition of	1.1-2.8 purple—yellow

				1 ml of 1N HCl per 100 ml of solution	
10	*m*-Cresol purple (*m*-cresolsulphophthalein); first change, (see No. 50)		0.04	20% alcohol	1.2-2.8 red — yellow
11	Thymol blue (thymolsulphophthalein); first change (see No. 53)		0.1	(a) 20% alcohol; (b) water with an addition of 4.3 ml of 0.05N NaOH per 100 mg of the indicator	1.2-2.8 red — yellow λ_{max} 544-430 nm

Table 19 (continued)

No.	Indicator	Formula	Concentration, %	Solvent	pH range and the indicator colour
12	Xylenol blue (*p*-xylenolsulphophthalein); first change (see No. 54)		0.04 0.05	(a) 20% alcohol; (b) water with an addition of 5.3 ml of 0.05*N* NaOH per 100 mg of the indicator	1.2-2.8 red—brown-yellow
13	Pentamethoxy red		0.1	70% alcohol	1.2-3.2 red-violet—colourless

14	Tropeolin 00 (orange IV; diphenyl orange)		1.0, 0.1 and 0.01	Water	1.4-3.2 red—yellow
15	Methyl violet; third change (see Nos. 1 and 7)	*See* No. 1	0.1	Water	2.0-3.0 blue—violet
16	Alizarin Yellow R; first change		0.1	Water	1.9-3.3 red—yellow
17	Benzyl orange		0.05	Water	1.9-3.3 red—yellow
18	Benzopurpurin 4B; first change (see No. 74)		0.1 0.5	Water 90% alcohol	1.3-4.0 bluish violet—orange

Table 19 (continued)

No.	Indicator	Formula	Concentration, %	Solvent	pH range and the indicator colour
19	β-Dinitrophenol (2,6-dinitrophenol)		0.1; 0.05 and 0.04	Water	2.4-4.0 colourless — yellow
20	α-Dinitrophenol (2,4-dinitrophenol)		Saturated and 0.04 0.1	Water Alcohol	2.8-4.4 colourless — yellow
21	Methyl yellow (butter yellow)		0.1 and 0.01	90% alcohol	2.9-4.0 red — yellow
22	Methyl orange (Helianthine B; orange III)		0.1	Water	3.1-4.4 red — orange-yellow λ_{max} 522-464 nm

23	Bromophenol blue (tetrabromophenolsulphophthalein)		0.1	(a) 20% alcohol; (b) water with an addition of 3.0 ml of 0.05N NaOH per 100 mg of the indicator	3.0-4.6 yellow — blue λ_{max} 436-592 nm
24	Bromochlorophenol blue		0.04	(a) 20% alcohol (b) water with an addition of 3.2 ml of 0.05N NaOH per 100 mg of the indicator	3.0-4.8 yellow — purple
25	Congo red		0.1 and 1.0	Water	3.0-5.2 bluish violet — red

Table 19 (continued)

No.	Indicator	Formula	Concentration, %	Solvent	pH range and the indicator colour
26	Alizarin Red S (Alizarin S, sodium alizarin sulphonate); first change (see No. 61)		0.1	Water	3.7-5.2 yellow—violet
27	Bromocresol blue (bromocresol green)		0.1	(a) 20% alcohol; (b) water with an addition of 2.9 ml of 0.05N NaOH per 100 mg of the indicator	3.8-5.4 yellow—blue λ_{max} 444-617 nm
28	α-Naphthyl red		0.1	70% alcohol	3.7-5.7 violet—brownish yellow

29	γ-Dinitrophenol (2,5-dinitrophenol)		0.1 and 0.025	Water	4.0-5.4 colourless — yellow
30	Lacmoid	$C_{12}H_9O_3N$	0.2 and 0.5	90% alcohol	4.0-6.4 red — blue
31	Methyl red		0.1 and 0.2	60% alcohol	4.2-6.2 red — yellow λ_{max} 530-427 nm
32	Chrysoidine		0.1	Water	4.0-7.0 orange — yellow
33	Iodeosin (tetraiodofluorescein)		0.1	Water (corresponding acid is dissolved in 70% alcohol)	4.5-6.5 colourless — red

Table 19 (continued)

No.	Indicator	Formula	Concentration, %	Solvent	pH range and the indicator colour
34	Hematoxylin		0.5	90% alcohol	5.0-6.0 yellow—violet
35	Chlorophenol red (dichlorophenolsulphophthalein)		0.1	(a) 20% alcohol; (b) water with an addition of 4.7 ml of 0.05*N* NaOH per 100 mg of the indicator	5.0-6.6 yellow—red

36	Bromophenol red (dibromophenolsulphophthalein)		0.1 and 0.04	(a) 20% alcohol; (b) water with an addition of 3.9 ml of 0.05*N* NaOH per 100 mg of the indicator	5.0-6.8 yellow—red
37	*o*-Nitrophenol		0.1	50% alcohol	5.0-7.0 colourless—yellow
38	Bromocresol purple (dibromine-*o*-cresolsulphophthalein)		0.1	(a) 20% alcohol; (b) water with an addition of 3.7 ml of 0.05*N* NaOH per 100 mg of the indicator	5.2-6.8 yellow—purple λ_{max} 433-591 nm

Table 19 (continued)

No.	Indicator	Formula	Concentration, %	Solvent	pH range and the indicator colour
39	Nitrazine yellow		0.1	Water	6.0-7.0 yellow—blue-violet
40	*p*-Nitrophenol		0.1	Water	5.6-7.6 colourless—yellow
41	Bromothymol blue (dibromothymolsulphophthalein)		0.05 and 0.1	(a) 20% alcohol; (b) water with an addition of 3.2 ml of 0.05*N* NaOH per 100 mg of the indicator	6.0-7.6 yellow—blue λ_{max} 433-617 nm

42	*p*-Rosolic acid (corallinophthalein; aurin; methylaurin; yellow coralline)		0.5 and 0.1	50% alcohol	6.2-8.0 yellow—red
43	Neutral red		0.1	60% alcohol	6.8-8.4 red—yellow-brown
44	Phenol red (phenolsulphophthalein)		0.1 and 0.05	(a) 20% alcohol; (b) water with an addition of 5.7 ml of 0.05N NaOH per 100 mg of the indicator	6.8-8.4 yellow—red λ_{max} 433-558 nm

Table 19 (continued)

No.	Indicator	Formula	Concentration, %	Solvent	pH range and the indicator colour
45	Quinoline blue (cyanine)		1.0	90% alcohol	7.0-8.0 colourless—violet
46	*m*-Nitrophenol		0.3	Water	6.8-8.4 colourless—yellow
47	Cresol red (*o*-cresolsulphophthalein)		0.1	(a) 50% alcohol; (b) water with an addition of 5.3 ml of 0.05*N* NaOH per 100 mg of the indicator	7.2-8.8 amber yellow—purple red λ_{max} 434-572 nm

48	α-Naphtholphthalein		0.1 and 1.0	70% alcohol	7.4-8.6 yellow-pink — blue-green
49	Ethyl-bis-(2,4-dinitrophenyl)-acetate	—	0.1	Alcohol	7.4-9.0 colourless — blue
50	*m*-Cresol purple; second change (see No. 10)	*See* No. 10			7.4-9.0 yellow — purple
51	Tropeolin 000		0.1 and 1.0	Water	7.6-8.9 yellow-green — pink

Table 19 (continued)

No.	Indicator	Formula	Con-cent-ration, %	Solvent	pH range and the indicator colour
52	Curcumin; first change		0.1	90% alcohol	7.4-9.2 yellow—brown-red
53	Thymol blue; second change (see No. 11)	*See* No. 11			8.0-9.6 yellow—blue λ_{max} 430-596 nm
54	Xylenol blue; second change (see No. 12)	*See* No. 12			8.0-9.6 yellow—blue
55	*o*-Cresolphthalein		0.2 and 0.02	90% alcohol	8.2-9.8 colourless—red

56	Phenolphthalein		0.1 and 1.0	60% alcohol	8.2-10.0 colourless—purple λ_{max} 553 nm
57	α-Naphtholhenzoin; second change (see No. 2)	*See* No. 2			8.4-10.0 yellow—blue
58	*p*-Xylenolphthalein		0.1	40% alcohol	9.3-10.5 colourless—blue

Table 19 (continued)

No.	Indicator	Formula	Concentration, %	Solvent	pH range and the indicator colour
59	Thymolphthalein		0.1 0.04	90% alcohol 50% alcohol	9.3-10.5 colourless—blue λ_{max} 598 nm
60	Nile blue		0.1	Water	10.1-11.1 blue—red
61	Alizarin Red S; second change (see No. 26)	*See* No. 26			10.0-12.0 violet—pale yellow

62	Curcumin; second change (see No. 52)	*See* No. 52			10.2-11.8 brown-red—orange-yellow
63	β-Naphthol violet		0.04	Water	10.0-12.1 orange-yellow—violet
64	Alizarin Yellow GG (salicyl yellow; mordant yellow)		0.1	Water	10.0-12.1 light yellow—dark orange
65	Alizarin Yellow R		0.1	Water.	10.1-12.1 yellow—lilac
66	Alizarin Yellow RS		0.1	Water	10.1-12.1 light yellow—brown-red

Table 19 (continued)

No.	Indicator	Formula	Concentration, %	Solvent	pH range and the indicator colour
67	Alizarin Blue BS		0.05	Water	11.0-13.0 orange-yellow — green-blue
68	Tropeolin 0 (gold yellow; chrysoine; resorcinol yellow)		0.1	Water	11.0-13.0 yellow—orange-brown
69	Malachite green; second change (see No. 6)	*See* No. 6			11.5-13.2 bluish green — colourless
70	2,4,6-Trinitrotoluene		0.1 and 0.5	90% alcohol	11.5-13.2 colourless — orange

71	Orange G		0.1	Water	11.5-14.0 yellow—red
72	Indigo carmine (sodium indigo disulphonate)		0.25	50% alcohol	11.6-14.0 blue—yellow
73	1,3,5-Trinitrobenzene		0.1 and 0.5	90% alcohol	12.2-14.0 colourless—orange
74	Benzopurpurin 4B; second change (see No. 18)	*See* No. 18			13.0-14.0 orange—red

Table 20

Ionic Product of Water at Temperatures Ranging from 0 °C to 100 °C

$$K_w = a_{H^+} \times a_{OH^-} \qquad \sqrt{K_w} = a_{H^+} = a_{OH^-}$$

t, °C	K_w	$\sqrt{K_w}$
0	$10^{-14.96} = 0.11 \times 10^{-14}$	$10^{-7.48} = 0.33 \times 10^{-7}$
5	$10^{-14.76} = 0.17 \times 10^{-14}$	$10^{-7.38} = 0.42 \times 10^{-7}$
10	$10^{-14.53} = 0.30 \times 10^{-14}$	$10^{-7.27} = 0.54 \times 10^{-7}$
15	$10^{-14.34} = 0.46 \times 10^{-14}$	$10^{-7.17} = 0.68 \times 10^{-7}$
16	$10^{-14.30} = 0.50 \times 10^{-14}$	$10^{-7.15} = 0.71 \times 10^{-7}$
17	$10^{-14.26} = 0.55 \times 10^{-14}$	$10^{-7.13} = 0.74 \times 10^{-7}$
18	$10^{-14.22} = 0.60 \times 10^{-14}$	$10^{-7.11} = 0.77 \times 10^{-7}$
19	$10^{-14.19} = 0.65 \times 10^{-14}$	$10^{-7.10} = 0.80 \times 10^{-7}$
20	$10^{-14.16} = 0.69 \times 10^{-14}$	$10^{-7.08} = 0.83 \times 10^{-7}$
21	$10^{-14.12} = 0.76 \times 10^{-14}$	$10^{-7.06} = 0.87 \times 10^{-7}$
22	$10^{-14.09} = 0.81 \times 10^{-14}$	$10^{-7.05} = 0.89 \times 10^{-7}$
23	$10^{-14.06} = 0.87 \times 10^{-14}$	$10^{-7.03} = 0.93 \times 10^{-7}$
24	$10^{-14.03} = 0.93 \times 10^{-14}$	$10^{-7.02} = 0.96 \times 10^{-7}$
25	$10^{-14.00} = 1.00 \times 10^{-14}$	$10^{-7.00} = 1.00 \times 10^{-7}$
26	$10^{-13.96} = 1.10 \times 10^{-14}$	$10^{-6.98} = 1.05 \times 10^{-7}$
27	$10^{-13.93} = 1.17 \times 10^{-14}$	$10^{-6.97} = 1.07 \times 10^{-7}$
28	$10^{-13.89} = 1.29 \times 10^{-14}$	$10^{-6.95} = 1.12 \times 10^{-7}$
29	$10^{-13.86} = 1.38 \times 10^{-14}$	$10^{-6.93} = 1.17 \times 10^{-7}$
30	$10^{-13.83} = 1.48 \times 10^{-14}$	$10^{-6.92} = 1.20 \times 10^{-7}$
31	$10^{-13.80} = 1.58 \times 10^{-14}$	$10^{-6.90} = 1.26 \times 10^{-7}$
32	$10^{-13.77} = 1.70 \times 10^{-14}$	$10^{-6.89} = 1.29 \times 10^{-7}$
33	$10^{-13.74} = 1.82 \times 10^{-14}$	$10^{-6.87} = 1.35 \times 10^{-7}$
34	$10^{-13.71} = 1.95 \times 10^{-14}$	$10^{-6.86} = 1.38 \times 10^{-7}$
35	$10^{-13.68} = 2.09 \times 10^{-14}$	$10^{-6.84} = 1.45 \times 10^{-7}$
36	$10^{-13.65} = 2.24 \times 10^{-14}$	$10^{-6.83} = 1.48 \times 10^{-7}$
37	$10^{-13.62} = 2.40 \times 10^{-14}$	$10^{-6.81} = 1.55 \times 10^{-7}$
38	$10^{-13.59} = 2.57 \times 10^{-14}$	$10^{-6.80} = 1.58 \times 10^{-7}$
39	$10^{-13.56} = 2.75 \times 10^{-14}$	$10^{-6.78} = 1.66 \times 10^{-7}$

Thymol blue; second change	—	+0.16	+0.12	+0.09	+0.05	0.00	—0.12	—0.19
Thymolphthalein	—	—	+0.11	+0.09	+0.05	0.00	—0.19	—

* For the use of the table, see p. 473.

Table 22

Ionization Constants of Indicators (pK_1; at different ionic strength)

(t = temperature of experiment)

A. Monochromatic Indicators

Indicator	pK_1 (at a zero ionic strength and different temperatures) $A = t - 20$°C	pK_1 (t=20°C) Ionic strength, μ 0.01	0.05	0.1	0.5
Pentamethoxy red	1.86 + 0.008 A	—	1.86	1.86	—
Quinaldine red	2.63 — 0.007 A	2.80	—	2.90	3.10
α-Dinitrophenol	4.10 — 0.006 A	—	3.95	3.90	3.80 (KCl)
β-Dinitrophenol	3.70 — 0.006 A	—	3.95	3.90	3.80 (KCl)
γ-Dinitrophenol	5.20 — 0.0045A	—	5.12	5.10	5.00 (NaCl)
p-Nitrophenol	7.00 — 0.011 A	—	—	—	—
m-Nitrophenol	8.35 — 0.01 A	—	8.30	8.25	8.15 (NaCl)

B. Dichromatic Indicators

Indicator	pK_1 (Ionic strength = =0)	pK_1 (t=20°C) Ionic strength, μ 0.01	0.05	0.1	0.5
Thymol blue (acid region)*	1.65 (15-30 °C)	—	1.65	1.65	1.65
Methyl orange*	3.46 — 0.014 (t = 20 °C)	3.46	3.46	3.46	3.46
Bromophenol blue	4.10 (15-20 °C)	4.06	4.00	3.85	3.75 (KCl)
Bromocresol blue (bromocresol green)	4.90 (15-30 °C)	4.80	4.70	4.66	4.50 (KCl) 4.42 (NaCl)
Methyl red* . . .	5.00 — 0.006 (t = 20 °C)	5.00	5.00	5.00	5.00
Chlorophenol red	6.25 — 0.005 (t = 20 °C)	6.15	6.05	6.00	5.9 (KCl) 5.85 (NaCl)
Bromocresol purple	6.40 — 0.005 (t = 20 °C)	6.28	6.21	6.12	5.9 (KCl) 5.8 (NaCl)
Bromothymol blue	7.30 (15-30 °C)	7.19	7.13	7.10	6.9 (KCl) 6.8 (NaCl)
Phenol red	8.00 — 0.007 (t = 20 °C)	7.92	7.84	7.81	7.6 (KCl) 7.5 (NaCl)
Thymol blue . . .	9.20 (15-30 °C)	9.01	8.95	8.90	—

* Methyl orange, methyl red and thymol blue (acid region) have an advantageous feature, i.e., their constants are scarcely affected by the electrolytes present, up to an ionic strength of 0.5.

Table 23

Some Mixed Indicators*

Titration index pT is the pH value whereby the observer clearly sees the change in the indicator's colour and recognizes titration as complete. This is a somewhat conditional quantity which differs from person to person who performs titration.

Titration index (pT)	Components	Ratio of volumes	Indicator colour: in acidic medium	Indicator colour: in alkaline medium
3.25	Methyl yellow, 0.1% solution in alcohol Methylene blue, 0.1% solution in alcohol	1 : 1	Blue-violet	Green
4.1	Methyl orange, 0.1% solution in water Indigo carmine, 0.25% solution in water	1 : 1	Violet	Green
4.3	Bromocresol blue, sodium salt, 0.1% solution in water Methyl orange, 0.2% solution in water	1 : 1	Yellow	Blue-green
5.1	Bromocresol blue, 0.1% solution in alcohol Methyl red, 0.2% solution in alcohol	3 : 1	Wine red	Green
5.4	Methyl red, 0.2% solution in alcohol Methylene blue, 0.1% solution in alcohol	1 : 1	Red-violet	Green
6.1	Bromocresol blue, sodium salt, 0.1% solution in water Chlorophenol red, sodium salt, 0.1% solution in water	1 : 1	Yellow-green	Blue-violet

* Indicators are kept in flasks of dark glass.

Table 23 (continued)

Titration index (pT)	Components	Ratio of volumes	Indicator colour	
			in acidic medium	in alkaline medium
6.7	Bromocresol purple, sodium salt, 0.1% solution in water Bromothymol blue, sodium salt, 0.1% solution in water	1 : 1	Yellow	Blue-violet
7.0	Neutral red, 0.1% solution in alcohol Methylene blue, 0.1% solution in alcohol	1 : 1	Violet-blue	Green
7.2	Neutral red, 0.1% solution in alcohol Bromothymol blue, 0.1% solution in alcohol	1 : 1	Pink	Green
7.5	Bromothymol blue, sodium salt, 0.1% solution in water Phenol red, sodium salt, 0.1% solution in water	1 : 1	Yellow	Violet
8.3	Cresol red, sodium salt, 0.1% solution in water Thymol blue, sodium salt, 0.1% solution in water	1 : 3	Yellow	Violet
8.9	α-Naphtholphthalein, 0.1% solution in alcohol Phenolphthalein, 0.1% solution in alcohol	1 : 3	Pale pink	Violet
9.0	Thymol blue, 0.1% solution in 50% alcohol Phenolphthalein, 0.1% solution in 50% alcohol	1 : 3	Yellow	Violet
9.9	Phenolphthalein, 0.1% solution in alcohol Thymolphthalein, 0.1% solution in alcohol	1 : 1	Colourless	Violet
10.2	Thymolphthalein, 0.1% solution in alcohol Alizarin yellow, 0.1% solution in alcohol	2 : 1	Yellow	Violet

Table 24

Universal Indicators

1. 100 mg of phenolphthalein, 200 mg of methyl red, 300 mg of methyl yellow, 400 mg of bromothymol blue and 500 mg of thymol blue are dissolved in 500 ml of 96% alcohol, then 0.1 *N* solution of caustic soda is added until the appearance of a pure yellow colour (pH 6).

Colour . .	Red	Orange	Yellow	Green	Blue
pH . . .	2.0	4.0	6.0	8.0	10.0

2. 15 ml of 0.1% solution of methyl yellow, 5 ml of 0.1% solution of methyl red, 20 ml of 0.1% solution of bromothymol blue, 20 ml of 0.1% solution of phenolphthalein and 20 ml of 0.1% solution of thymolphthalein are mixed.

Colour	Pink	Red-orange	Orange
pH	1.0	3.0	4.0
Colour	Yellow-orange	Lemon yellow	Yellow-green
pH	5.0	6.0	7.0
Colour	Green	Blue-green	Violet
pH	8.0	9.0	10.0

3. 70 mg of tropeolin 00, 100 mg of methyl orange, 80 mg of methyl red, 400 mg of bromothymol blue, 500 mg of phenolphthalein and 100 mg of alizarin yellow R are dissolved in 100 ml of 50% alcohol.

Colour	Orange-red	Red-orange	Orange
pH	2.0	3.0	4.0
Colour	Yellow-orange	Orange-yellow	Yellow
pH	5.0	6.0	6.5
Colour	Green-yellow	Green	Green-blue
pH	7.0	8.0	9.0
Colour	Blue-violet	Violet	Red-violet
pH	9.5	10.0	12.0

4. 100 mg of methyl red, 100 mg of bromothymol blue, 100 mg of α-naphtholphthalein, 100 mg of phenolphthalein and 100 mg of thymolphthalein are dissolved in 500 ml of 96% alcohol.

Colour . .	Red	Orange	Yellow	Green-yellow
pH	4.0	5.0	6.0	7.0
Colour	Green	Blue-green	Blue-violet	Red-violet
pH	8.0	9.0	10.0	11.0

Table 25

Chief Fluorescent Indicators

(in the order of the growth of the pH of fluorescence change)

No.	Indicator	Formula	pH range	Change in fluorescence
1	β-Methylumbelliferone (4-methylumbelliferone; 7-hydroxy-4-methylcoumarin); first change (see No. 18)		0.0-2.0	Green—pale blue
2	Benzoflavin		0.3-1.7	Yellow—green

3	4-Ethoxyacridone		1.4-3.2	Green—blue
4	Esculin		1.5-2.0	Absence—blue
5	1,5-Naphthylaminesulphamide; first change		2.0-4.0	Intensification of yellow-orange fluorescence

Table 25 (continued)

No.	Indicator	Formula	pH range	Change in fluorescence
6	Phloxine (3′, 6′-dichloro-2, 4, 5, 7-tetrabromofluorescein)		2.0-4.0	Absence—yellow-orange
7	Salicylic acid		2.5-3.5	Intensification of blue fluorescence

8	Eosine (tetrabromofluorescein)		2.5-4.5	Intensification of yellow-green fluorescence
9	β-Naphthylamine (2-naphthylamine)		2.8-4.4	Intensification of violet fluorescence
10	Erythrosine (tetraiodofluorescein)		3.0-4.2	Intensification of blue-green fluorescence

Table 25 (continued)

No.	Indicator	Formula	pH range	Change in fluorescence
11	Dimethylnaphtheirhodine		3.2-3.8	Lilac—orange
12	α-Naphthylamine (1-naphthylamine); first change (see No. 32)		3.4-4.8	Intensification of blue fluorescence
13	Chromotropic acid		3.5-6.0	Intensification of blue fluorescence

14	Fluorescein		4.0-5.0	Intensification of green fluorescence
15	Quinic acid	$C_6H_7(OH)_4COOH$	4.0-5.0	Yellow—blue
16	Quinine; first change (see No. 28)	$C_{20}H_{24}O_2N_2$	3.8-6.1	Blue—violet
17	Acridine		4.8-6.6	Green—violet-blue
18	β-Methylumbelliferone; second change (see No. 1)	*See* No. 1	5.0-7.6	Intensification of blue fluorescence
19	β-Naphthoquinoline		5.0-8.0	Brilliant blue—pale violet

Table 25 (continued)

No.	Indicator	Formula	pH range	Change in fluorescence
20	3,6-Dioxyphthalimide		6.0-8.0	Green—yellow-green
21	Umbelliferone		6.5-7.6	Absence—blue
22	β-Naphthol (2-naphthol)		7.0-8.5	Pale blue—blue-violet

23	2,3-Dicyanhydroquinone		6.8-8.8	Blue—green
24	G-Salt		7.4-9.0	Intensification of blue fluorescence
25	Morin (3, 5, 7, 2′, 4′-pentaoxyflavone)		7.0-10.0	Green—yellow
26	R-Salt		8.0-10.6	Intensification of blue fluorescence

Table 25 (continued)

No.	Indicator	Formula	pH range	Change in fluorescence
27	Euchrysine 3R (base of acridine orange)		8.4-10.4	Orange—green
28	Quinine; second change (see No. 16)	*See* No. 16	9.5-10.5	Violet—absence
29	1,5-Naphthylaminesulphamide; second change (see No. 5)	*See* No. 5	9.5-13.0	Yellow-orange—green
30	Coumarin		9.8-12.0	Dark green—light yellow

31	SS-Acid		10.0-12.0	Violet—green
32	α-Naphthylamine; second change (see No. 12)	*See* No. 12	12.0-13.0	Weakening of blue fluorescence
33	Naphthionic acid		11.5-14.0	Violet-blue—bluish green

Table 26

Selected Chemiluminescent Indicators

Indicator	Formula	pH at which luminescence occurs
N, N′-Dimethylbiacridene		~9
Lophine (2, 4, 5-Triphenylimidazole; 2, 4, 5-triphenylglyoxaline		8.9-9.4

Luminol		8.0-8.5
Lucigenin		9.0-10.0

Table 27

Principal Adsorption Indicators

No.	Indicator	Formula	Ion of titrating reagent	Ion being determined	Change in colour
1	Alizarin Red S (0.4% aqueous solution)	*See* Table 19, No. 26 (p. 184)	Pb^{2+}	$Fe(CN)_6^{4-}$	Yellow—pink-red
2	Bengali pink (3′, 6′-dichloro-2, 4, 5, 7-tetraiodofluorescein, potash salt) (0.5% aqueous solution)		Ag^+	I^-	Pink—violet
3	Bromocresol blue (bromocresol green) (1% solution in 20% alcohol)	*See* Table 19, No. 27 (p. 184)	Ag^+	Cl^-	Violet—greenish blue
4	Bromophenol blue (0.1% alcohol solution or 0.1% aqueous solution of sodium salt)	*See* Table 19, No. 23 (p. 183)	Ag^+	Cl^-, Br^-, SCN^- I^-	Yellow—blue Yellow-green—blue-green

5	Congo red (0.1% aqueous solution)	*See* Table 19, No. 25 (p. 183)	Ag^+	Cl^-, Br^-, I^-	Red—blue
6	3,6-Dichlorofluorescein (0.1% solution in 60-70% alcohol, or 0.1% solution of sodium salt in water)		Ag^+	Cl^-, Br^- SCN^- I^-	Red-violet—blue-violet Pink—red-violet Yellow-green—orange
7	Diphenylcarbazide		Hg_2^{2+}	Cl^-, Br^-	Colourless—violet
8	Diphenylcarbazone (0.2% alcohol solution)		Ag^+	Cl^- Br^-, I^- SCN^-	Light red—violet Yellow—green Pink—blue

Table 27 (continued)

No.	Indicator	Formula	Ion of titrating reagent	Ion being determined	Change in colour
9	Eosine (0.5% solution of sodium salt in water or 0.1% solution of eosine in 60-70% alcohol)	*See* Table 25, No. 8 (p. 207)	Ag^+	Br^-, I^-, SCN^-	Orange—intense red
10	Erythrosine (0.5% aqueous solution)	*See* Table 25, No. 10 (p. 207)	Pb^{2+}	MoO_4^{2-}	Orange—dark red
11	Fluorescein (0.1% alcohol solution)	*See* Table 25, No. 14 (p. 209)	Ag^+	Cl^-, Br^-, SCN^- I^-	Yellow-green—pink Yellow-green—orange
12	Fuchsin (0.1% alcohol solution)		Ag^+	Cl^- Br^-, I^- SCN^-	Red-violet—pink Orange—pink Bluish—pink

13	Phenosafranine (0.1% aqueous solution)		Ag^+	Cl^- Br^-	Violet—pink Red-violet—blue
14	Rhodamine 6G (0.1% aqueous solution)		Ag^+	Br^-, Cl^-	Red-violet—orange
15	Tartrazine		Ag^+	Cl^-, Br^-, I^-, SCN^-	Yellow-green—yellow-brown
16	Tropeolin 00 (1% aqueous solution)	*See* Table 19, No. 14 (p. 181)	Ag^+	Cl^-	Yellow—pink

Table 28

Indicators Commonly Used in Complexonometry

No.	Indicator	Formula
1	Acid Chrome Black Special (Chrome Black Special ET 00; Eriochrome Black T)	
* RE stands for rare-earth elements, lanthanoids.

Concentration	Ions being determined *	Conditions of determination	Change in colour
Mixture of indicator (1 wt. %) and solid sodium chloride	Al^{3+}	pH 7-8; back titration with a zinc salt solution in the presence of pyridine	Wine red—blue
	Ba^{2+}	pH 10; titration in the presence of magnesium complexonate	
	Bi^{3+}	pH 9-10; back titration with a zinc salt solution	
	Ca^{2+}	pH 10; addition of magnesium complexonate	
	Cd^{2+}, Co^{3+}, Mg^{2+}, Zn^{2+}	pH 10	
	Cr^{3+}	Alkaline medium; back titration with a manganese salt solution	
	Fe^{3+}, Ti^{IV}	Back titration with a zinc salt solution in the presence of pyridine	
	Ga^{3+}	pH 6.5-9.5; back titration with a zinc salt solution	
	Hg^{2+}	pH 9-10; addition of magnesium complexonate	
	In^{3+}	pH 8-10; in the presence of potassium-sodium tartrate	
	Mn^{2+}	pH 10; addition of hydroxylamine	

No.	Indicator	Formula
1	Acid Chrome Black Special (Chrome Black Special ET 00; Eriochrome Black T)	2	Acid Chrome Blue K	3	Acid Chrome Dark Green G (palatine chrome green)	4	Alizarin Red S	*See* Table 19, No. 26 (p. 184)

Table 28 (continued)

Concentration	Ions being determined	Conditions of determination	Change in colour
Mixture of indicator (1 wt. %) and solid sodium chloride	Ni^{2+}, Pb^{2+}	pH 10; back titration with a magnesium salt or a zinc salt solution	Wine red—blue
	Tl^{3+}	pH 10; back titration with a magnesium salt solution or an addition of magnesium complexonate	
	V^{IV}	pH 10; back titration with a manganese salt solution	
Aqueous solution	Ca^{2+}	pH 12	Pink—gray-blue
	Mg^{2+}	pH 10-11; ammonia buffer	
	Cd^{2+}, Zn^{2+}	pH 9-10; ammonia buffer	
	Mn^{2+}	pH 10; ammonia buffer	
	Pb^{2+}	pH 10; in the presence of tartrate	
0.5% aqueous solution	Ca^{2+}	pH > 12. Used in mixture with 0.25% aqueous solution of naphthol yellow in the ratio of 1 : 2 (hydrone II)	Brownish orange—green
	Ga^{3+}	pH 3	Blue—pink
0.05% aqueous solution	Th^{IV}, RE	pH 2.2-3.4	Pink—yellow
	Sc^{3+}	pH 2	
	Al^{3+}	pH 3.5-3.6; back titration with a thorium nitrate solution	Yellow—pink

No.	Indicator	Formula
5	Arsenazo I	*See* Table 49, No. 7 (p. 362)
6	Benzidine	7	Beryllon II	8	Bromopyro-gallol red, BPR	
Table 28 (continued)

Concentration	Ions being determined	Conditions of determination	Change in colour
—	Pu^{IV} Th^{IV} U^{IV} RE Ca^{2+}, Mg^{2+}	0.1-0.2*M* HCl pH 1.6-3 pH 1.7 pH 7 pH 10	Violet—pink
1% solution in glacial acetic acid	Al^{3+}, Bi^{3+}, Fe^{3+}, Ga^{3+}, Sn^{IV}, Ti^{IV}	Buffer solution: 500 g of ammonium acetate and 20 ml of glacial acetic acid in one litre. Addition of $Fe(CN)_6^{4-}$ and $Fe(CN)_6^{3-}$, and back titration with a zinc acetate solution	Colourless—blue
0.02% aqueous solution	Be^{2+} Mg^{2+}	pH 12-13.2 pH 10	Blue—violet Blue-violet—violet-red
0.5% solution in 50% alcohol	Bi^{3+} Pb^{2+} Ni^{2+}, Co^{2+}, Cd^{2+} Mg^{2+}, Mn^{2+} Pd^{2+}, Tl^{3+}, Fe^{3+}, In^{3+}, Ga^{3+}	pH 2-3; HNO_3 pH 5-6 pH 9.3; ammonia buffer pH 10; ammonia buffer Back titration with a lead salt or a bismuth salt solution	Red—orange-yellow Blue-violet—red Blue—wine red Blue—violet-red

No.	Indicator	Formula
9	Calcein: *see* Fluorexone, No. 24 (p. 232)	
10	Calces (Patton-Reeder Dye; HHSNN)	11	Calcion	12	Calcon (Acid Alizarin Red V; Eriochrome Red RE)	13	Chalcone (Eriochrome Blue-Black R; Erio R)	
Table 28 (continued)

	Concentration	Ions being determined	Conditions of determination	Change in colour
	Mixture of indicator (1 wt. %) and solid sodium chloride	Ca^{2+}	pH 12-14	Wine red—blue
	—	Ca^{2+}	pH $>$ 12	Crimson—brilliant blue
	0.35% aqueous solution (10 ml) with the addition of 0.02% aqueous solution of methylene blue (10 ml), 0.4% solution of potassium salt (calculated on the basis of Ca^{2+}) (5 ml) and water (25 ml)	Ca^{2+}	pH 13	Yellow—orange-red
	—	Ca^{2+} Cd^{2+} Mg^{2+}, Mn^{2+}, Zn^{2+}	pH 14.5; NH_3; pH 12.5-13; NaOH pH 11.5; NH_3 pH 10; ammonia buffer	Pink—blue

No.	Indicator	Formula
14	Chromasurol S (Eriochromasurol S; alberone)	15	Chromogen Black Special ET 00: *See* Acid Chrome Black Spe-	
16	Chromoxane Green GG	
Table 28 (continued)

Concentration	Ions being determined	Conditions of determination	Change in colour
0.4% aqueous solution	Al^{3+}	pH 4; acetate buffer, 80 °C	Violet—yellow-orange
	Ca^{2+}	pH 11; NH_3	Pale red-orange—yellow
	Cu^{2+}	pH 6-6.5; acetate buffer	Blue or blue-violet—green
		pH 8-10; NH_3	Violet—yellow or yellow-green
	Fe^{3+}	pH 2-3; chloroacetic-acetate buffer, 60 °C	Greenish blue—yellow-orange
	Mg^{2+}	pH 11; NH_3	Dirty red—yellow
	Ni^{2+}	pH 11; NH_3	Blue-violet—yellow
	RE^{3+}	pH 8; pyridine + + NH_3	Violet—yellow
	Th^{IV}	pH 1-3; HNO_3	Red-violet—orange
	VO^{2+}	pH 4; acetate buffer	Blue-violet—red-orange

cial, No. 1 (p. 220)

—	Mg^{2+}, Ca^{2+}	pH 11	Red—green
	Cu^{2+}	pH 8	Red—orange
	Ni^{2+}	pH 11	Red—green
	Th^{IV}	pH 4.8	Violet—red
	VO^{2+}	pH 4	

No.	Indicator	Formula
17	3, 3′-Dimethylnaphthidine (DMN)	18	Diphenyl carbazone	*See* Table 27, No. 8 (p. 217)
19	Dithizone	*See* Table 49, No. 43 (p. 376)
20	Eriochrome Black T: *See* Acid Chrome Black Special, No. 1	
21	Eriochrome Blue-Black B	
Table 28 (continued)

Concentration	Ions being determined	Conditions of determination	Change in colour
1% solution in glacial acetic acid	Zn^{2+} Al^{3+}, Cd^{2+}, Cu^{2+}, Ni^{2+}, Pd^{2+}	pH 5; in the presence of $Fe(CN)_6^{3-}$ pH 5; back titration in the presence of $Fe(CN)_6^{3-}$	Violet—colourless
0.2% alcohol solution	Hg^{2+} Pb^{2+}	pH 1; HCl-KCl pH 4.5-6.5; acetic-acetate buffer	Blue-violet—colourless Red—colourless
0.075% solution in ethyl alcohol	Cd^{2+} Zn^{2+} Ni^{2+} Pb^{2+} Al^{3+}	pH 4.5; 50% alcohol pH 4-6; 50% alcohol or dimethyl ketone pH 4.5; 60% alcohol pH 4.7-5.4; 50% alcohol in the presence of urotropine buffer pH 4-5; 50% alcohol; back titration with a zinc salt solution	Pink—yellow Pink—blue, green or yellow, depending on pH Pink—yellow Pink—yellow
(p. 220)			
0.4% solution in methanol	Ca^{2+}, Cd^{2+} Mg^{2+}, Zn^{2+} U^{IV} Zr^{IV}	pH 11.5; NH_3 pH 10; ammonia buffer 0.01-0.2*M* HCl, hot solution 0.01-0.5*M* HCl; 50% methanol, hot solution	Red—blue Red—blue Blue—red Blue—red

No.	Indicator	Formula
22	Eriochrome Red B	23	Eriochrome Cyanine R	24	Fluorexone (calcein, fluorescein complexone)	
Table 28 (continued)

Concentration	Ions being determined	Conditions of determination	Change in colour
—	Ca^{2+}	pH 10; ammonia buffer	Red—yellow
	Cu^{2+}	pH 2; chloroacetic acid	Purple—yellow
		pH 4; acetate buffer	Purple—green
	Mn^{2+}	pH 8-10; ammonia buffer; ascorbic acid	Red—yellow
	Ni^{2+}	pH 4-6; acetate buffer	Purple—pale yellow
	Pb^{2+}	pH 10; ammonia buffer; tartrate	Orange red—yellow
	Zn^{2+}	pH 6.5; urotropine buffer	Red—yellow
0.4% aqueous solution	Al^{3+}	pH 5-6.3; acetate buffer, back titration with a zinc salt solution, 70-80 °C	Yellow—violet
	Zr^{IV}	pH 1.4; hot solution	Pink—colourless
	Fe^{3+}	pH 2-3; cloroacetic acid-acetate, 60 °C	Violet—yellow or green
	Th^{IV}	pH 2-2.5	Purple—pink
2% aqueous solution or solid mixture with KNO_3 in the ratio of 1 : 100	Ca^{2+}	pH $>$ 12; KOH or NaOH	Fluorescence—blue or green
	Ba^{2+}, Sr^{2+}	pH 11.5; NH_3 or pH 12.5; KOH	Fluorescence—pink, almost colourless
	Cu^{2+}	pH 10-11; ammonia buffer	
	Mn^{2+}	pH 8-11; ammonia buffer + NH_2OH	

No.	Indicator	Formula
25	Glycinthymol blue (GTB)	26	Glyoxal-bis-(2-hydroxyanil) (GBHA)	27	Hematoxylin	*See* Table 19, No. 34 (p. 186)
28	Hydroxyhydroquinone pink (hydroxyhydroquinone sulphophthalein)	29	Magneson	
Table 28 (continued)

Concentration	Ions being determined	Conditions of determination	Change in colour
0.1% aqueous solution	Cu^{2+} Zn^{2+}	pH 5-6; urotropine buffer pH 7.5; pyridine buffer	Blue—yellow
—	Ca^{2+}	pH 13 (in the presence of KCN, the end point is more distinct)	Pink—yellow
0.5% solution in 90% alcohol	Al^{3+} Bi^{3+} Th^{IV} Zr^{IV}	pH 6; back titration with an aluminium salt solution pH 1-2; HNO_3 pH 2 pH 1-1.5	Yellow-green—pink Pink—pale yellow Orange—yellow Pink—yellow
0.1% aqueous solution	Th^{IV}, Bi^{3+}	pH 2.4-3; acetate buffer	Pink—yellow
0.01% solution in water or acetone	Mg^{2+} Ca^{2+}, Cd^{2+} Ba^{2+}, Sr^{2+} Ni^{2+}	pH 9.8-11.2 pH 11.5; NH_3 pH 12.5; $(C_2H_5)_2NH$ acetate buffer pH 4; hot solution	Red—blue Red—orange

No.	Indicator	Formula
30	Metallphthalein: *See* Phthalein complexone, No. 39 (p. 242)	
31	Methylthymol blue (MTB)	
Table 28 (continued)

Concentration	Ions being determined	Conditions of determination	Change in colour
Solid mixture of the indicator with KNO_3 in the ratio of 1 : 100	Ba^{2+}, Sr^{2+}	pH 10-11; ammonia buffer	Blue—gray
	Ca^{2+}	pH 12; NH_3 or NaOH	
	Mg^{2+}	pH 10-11.5; ammonia buffer	
	Bi^{3+}	pH 1-3; HNO_3	Blue—yellow
	Cd^{2+}, Co^{2+}	pH 5-6; urotropine buffer	
		pH 12; NH_3	Blue—gray or colourless
	Cu^{2+}	pH 11.5; NH_3	Blue—colourless or gray-green
	Fe^{2+}	pH 4.5-6.5; urotropine buffer	Blue—yellow
	Hg^{2+}	pH 6; urotropine buffer	
	In^{3+}	pH 3-4; acetate buffer	
	Mn^{2+}	pH 6-6.5; urotropine buffer	Blue—yellow
		pH 11.5; NH_3	Blue—gray
	Pb^{2+}	pH 6; urotropine buffer	Blue—yellow
		pH 12; NH_3 in the presence of tartrate	Blue—gray
	RE	pH 6; urotropine buffer	Blue—yellow
		pH 2.2; HNO_3	
	Sn^{2+}	pH 5.5-6; pyridine + acetate + F^-	Blue—yellow
	Zn^{2+}	pH 6-6.5; urotropine buffer	Blue—yellow
		pH 12; NH_3	Blue—gray
	Zr^{IV}	pH 1-2; chloroacetic acid, 90 °C	Blue—red
	Ga^{3+}, In^{3+}	pH 4.5-6; acetate buffer	Disappearance of fluorescence

No.	Indicator	Formula
32	Morin: *See* Table 25, No. 25 (p. 211)	
33	Murexide	34	Naphthol yellow	35	Naphthylazoxine	36	PAN[1-(2-pyridylazo)-naphthol-2]	
Table 28 (continued)

Concentration	Ions being determined	Conditions of determination	Change in colour
	Ga^{3+}, In^{3+}	pH 4.5-6; acetate buffer	Disappearance of fluorescence
Mixture of the indicator (0.2 wt. %) and solid sodium chloride	Ca^{2+} Co^{2+} Cu^{2+} Ni^{2+} Ag^{+} Pd^{2+}	pH $\geqslant$ 12 pH 8; NH_3 pH 7-8; NH_3 pH 8.5-9.5; NH_3 pH 10-11.5; NH_3 Addition of $K_2Ni(CN)_4$ + + NH_4OH	Red—violet Orange—violet Red—violet Yellow—violet
Used in mixture with Acid Chrome Dark Green G (No. 3)			
—	Cu^{2+} Mn^{2+} Ni^{2+} Pb^{2+}	pH 3.5-6.5; acetate buffer pH 9.3; ammonia buffer pH 6.7-7.0; acetate buffer pH 5.5-6.5; acetate or pyridine buffer pH 6-6.5; acetate or pyridine buffer	Yellow—red Yellow-green—pink Yellow—red
0.1% solution in ethanol or methanol	Bi^{3+}	pH 1-3; HNO_3	Red—yellow-green

No.	Indicator	Formula
36	PAN [1-(2-pyridylazo)-naphthol-2]	37	PAR [4-(2-pyridylazo)-resorcinol]	
Table 28 (continued)

Concentration	Ions being determined	Conditions of determination	Change in colour
0.1% solution in ethanol or methanol	Cd^{2+}	pH 5-6; acetate buffer	Pink—yellow-green
	Cu^{2+}	pH 3-5; acetate buffer, 70-80 °C	
		pH 9-10; ammonia buffer, 50 °C	Violet—yellow
	In^{3+}	pH 2.3-2.5; acetate buffer, hot solution	Red—yellow
	Ni^{2+}	pH 4; 25% methanol, 50-70 °C	Violet-red—yellow
	Th^{IV}	pH 2-3.5; HNO_3	Red—yellow
	Tl^{3+}	pH > 1.8; chloroacetic acid, hot solution	
	Zn^{2+}	pH 4-6; acetate buffer	
	Al^{3+}, Ca^{2+}, Co^{2+}, Fe^{3+}, Hg^{2+}, Ga^{3+}, Mg^{2+}, Mn^{2+}, Mo^{V}, Ni^{2+}, Pb^{2+}, RE, UO_2^{2+}, VO^{2+}	Back titration with a cupric salt solution	
0.1% aqueous solution	Bi^{3+}	pH 1-2; HNO_3	Red—yellow
	Tl^{3+}	pH 1.7; hot solution	
	In^{3+}	pH 2.3-2.5; 60-70 °C	
	Hg^{2+}	pH 3-6	Red—yellow-orange
	Cd^{2+}	pH 6-11.5; ammonia or urotropine buffer	Red—yellow
	Cu^{2+}	pH 5; acetate buffer pH 6; urotropine buffer pH 11.5; ammonia buffer	Wine red—yellow or green

No.	Indicator	Formula
37	PAR [4-(2-pyridyl-azo)-resorcinol]	38	Patton-Reeder Dye: *See* Calces, No. 10 (p. 226)	
39	Phthalein complexone (metallphthalein; phthalein purple; cresolphthalexone)	40	Pyrocatechin violet (pyrocatechin sulphophthalein)	
Table 28 (continued)

Concentration	Ions being determined	Conditions of determination	Change in colour
0.1% aqueous solution	Mn^{2+}	pH 9; ammonia buffer	Red—yellow
	Ni^{2+}	pH 5; acetate buffer, 90 °C	Red—yellow
	Pb^{2+}	pH 5-9.6; urotropine or ammonia buffer	Red—yellow
	RE and Y^{3+}	pH 6; acetate buffer	Red—yellow
	Zn^{2+}	pH 5-11.5; urotropine or ammonia buffer	Red—yellow

Concentration	Ions being determined	Conditions of determination	Change in colour
(a) 0.5% aqueous solution	Ba^{2+}, Sr^{2+}	pH 10.5-11; addition of ethanol	(a) Red-violet—pale pink or colourless
(b) mixture of 0.1 g of phthalein complexone, 0.005 g of methyl red and 0.005 g of diamine green in 100 ml of water	Mg^{2+}	pH 10-11; NH_3; addition of ethanol	(b) Red—pale gray
	Ca^{2+}	pH 10-11	
	Cd^{2+}	pH 10; ammonia buffer + 30% of ethanol	

Concentration	Ions being determined	Conditions of determination	Change in colour
0.1% aqueous solution	Bi^{3+}	pH 2-3; HNO_3	Blue—yellow
	Cd^{2+}	pH 10; ammonia buffer	Greenish blue—red-violet
	Co^{2+}	pH 9.3; ammonia buffer	
	Ni^{2+}	pH 8-9.3; ammonia buffer	
	Cu^{2+}	pH 5-6.5; acetate buffer	Blue—yellow
		pH 6-7; pyridine buffer	
		pH 9.3; ammonia buffer	Blue—red-violet

No.	Indicator	Formula
40	Pyrocatechin violet (pyrocatechin sulphophthalein)	41	Pyrogallol red	
Table 28 (continued)

Concentration	Ions being determined	Conditions of determination	Change in colour
0.1% aqueous solution	Fe^{3+}	pH 5-6; pyridine-acetate buffer	Blue—yellow-green

	Th^{IV}	pH 1.7-3.5; HNO_3	
	Zr^{IV}	HNO_3; 1*M*, 90 °C	
	Sc^{3+}	pH 2.2-5	
	In^{3+}	pH 3-3.5; acetate buffer, hot solution	
	Hg^{2+}, Tl^{3+}	pH 4-5; acetate buffer	
	Cd^{2+}, Fe^{2+}	pH 5-6; urotropine buffer	
	Co^{2+}	pH 5-6; urotropine buffer, 80 °C	Red-violet—yellow
	RE^{3+}	pH 5-6; urotropine buffer, hot solution	Red—yellow
	Pb^{2+}	pH 5; acetate buffer or pH 6; urotropine buffer	
	Zn^{2+}	pH 5-6; acetate buffer; pH 7; urotropine buffer	
	Fe^{3+}	pH 1.5; in the presence of Fe^{2+}, CO_2 atmosphere, 60 °C	Blue-violet—yellow
	Al^{3+}, Fe^{3+}, Ga^{3+}, Ni^{2+}, Pd^{2+}, Sn^{IV}, U^{IV}, VO^{2+}	Back titration with a thorium (IV) salt solution	
0.130 g of the indicator and 2 ml of 1*M* NaOH solution in 100 ml of water	Ca^{2+}, Ge^{IV}, Co^{2+}, Cu^{2+}, Fe^{3+}, In^{3+}, Mn^{2+}, Pb^{2+}	pH 9-10; back titration with a zinc salt solution	
	Zn^{2+}	pH 9-10; ammonia buffer	Blue—yellow

Table 29

Hydrogen Ion Exponent (pH) Evaluated in Terms of the Activity of Hydrogen Ions (a_{H^+}) and Vice Versa (pH = — log a_{H^+})

The table can be used to convert the indices of the solubility product pSP into the solubility product SP, the indices of constants pK into constants K, and in other similar cases.

Decimal fractions of pH	Centesimal fractions of pH									
	.00	.01	.02	.03	.04	.05	.06	.07	.08	.09
	values of a_{H^+}

To calculate a_{H^+} by a known pH, the first digit of the mantissa of the pH value is found in the first vertical column, and the second digit of this mantissa is found in the first horizontal line. The value of a_{H^+} is obtained at the intersection of the lines which start from the figures found. This value must be multiplied by 10 to the power equal to the characteristic of the pH taken with a negative sign. For example: pH = 6.27; $a_{H^+} = 0.537 \times 10^{-6}$.

To calculate the pH by a known value of a_{H^+}, the latter should be expressed by a number which starts with 0 and is multiplied by 10 to a certain negative power. Then, this number (or one close to it) is found in the table and, proceeding from it to the left and upward, two digits are obtained after the decimal in the pH value. The characteristic of the pH will be equal to the power to which 10 is raised in the number of a_{H^+}, but with a positive sign. For example, $a_{H^+} = 2.41 \times 10^{-7} = 0.241 \times 10^{-6}$; pH = 6.62.

Table 30

Preparation of Buffer Solutions

(pH ranging from 1.10 to 12.90; $t = 20\,°C$)

Stock solutions

Solution No. 1: hydrochloric acid, 0.1*N*.

Solution No. 2: glycocoll NH_2CH_2COOH (aminoacetic acid, glycin), 0.1*N* (7.507 g of glycocoll + 5.85 g of NaCl in one litre).

Solution No. 3: potassium hydrophthalate, $KHC_8H_4O_4$ 0.2*M* (40.846 g in one litre).

Solution No. 4: sodium citrate, 0.1*M* (21.014 g of $H_3C_6H_5O_7 \cdot H_2O$ + + 200 ml of 1*N* NaOH solution in one litre).

Solution No. 5: caustic soda, 0.1*N*.

Solution No. 6: potassium dehydrophosphate, 1/15*M* (9.073 g of KH_2PO_4 in one litre).

Solution No. 7: sodium hydrophosphate, 1/15*M* (11.866 g of $Na_2HPO_4 \cdot 2H_2O$ in one litre).

Solution No. 8: sodium tetraborate, 0.05*M* (12.367 g of H_3BO_3 + + 100 ml of 1*N* NaOH solution in one litre).

Chemically pure sodium chloride is recrystallized twice and dried at a temperature of 120 °C; chemically pure boric acid is recrystallized twice out of boiling water and dried at a temperature of not over 80 °C; chemically pure potassium dehydrophosphate is recrystallized twice and dried at a temperature of 110-120 °C; chemically pure sodium hydrophosphate is recrystallized twice (during the last crystallization, the temperature of the solution must not be over 90 °C), then damped with water and dried for two days in a thermostat at a temperature of 36 °C; chemically pure citric acid is recrystallized twice (during the last crystallization, the temperature must not be higher than 60 °C); potassium hydrophthalate is recrystallized twice and dried at a temperature of 110-120 °C.

A. Buffer Solutions with pH 1.10-3.50 (HCl-NH_2CH_2COOH)

Every given amount of the solution (solution No. 2, see above) is brought up to 100 ml with solution No. 1 (see above)

Table 31

Acetic-Acetate Buffer Solutions

To prepare a buffer solution of the required pH value, the given amount of 1*N* acetic acid solution is measured, 50 ml of 1*N* caustic soda solution is added to it, and the mixture is brought up to 500 ml with distilled water.

pH	Acetic acid, 1*N*, ml	pH	Acetic acid, 1*N*, ml	pH	Acetic acid, 1*N*, ml
3.8	421.5	4.67	100.0	5.5	57.4
3.9	345.1	4.7	96.8	5.6	55.9

Table 33

Buffer Solutions from Individual Substances

Substance	pH
Saturated potassium hydrotartrate solution (~0.025*M*) $KHC_4H_4O_6$ (molecular weight: 188.183)	3.59 (16 °C)
Saturated piperazine phosphate* solution (~0.065*M*) $C_4H_{12}N_2HPO_4 \cdot H_2O$ (molecular weight: 202.148)	6.36 (16 °C) 6.34 (18 °C)
0.05*M* sodium tetraborate solution $Na_2B_4O_7 \times$ $\times$ $10H_2O$ (molecular weight: 381.37)	9.18 (25 °C) 9.07 (38 °C)

* Piperazine phosphate is prepared by mixing, at room temperature, equimolecular quantities of piperazine and phosphoric acid with the subsequent crystallization of separated white lamellar crystals.

Table 34

Determination of Electrode Potentials

For the reaction

$$Me^{n+} + ne \rightleftharpoons Me^0,$$

the mathematical expression of the potential value of the metallic electrode immersed into a solution containing its ions is determined by the formula:

$$E_{Me^{n+}/Me^0} = E^0_{Me^{n+}/Me^0} + \frac{RT}{nF} \ln a_{Me^{n+}}$$

For an oxidation-reduction reaction with the participation of hydrogen ions

$$a\,\text{Ox.} + m\,H^+ + ne \rightleftharpoons b\,\text{Red.} + \frac{m}{2} H_2O$$

the potential value of an electrode from platinum or other noble metal immersed into a solution of a mixture of oxidized and reduced forms of a given compound is determined by the formula:

$$E_{\text{Ox./Red.}} = E^0_{\text{Ox./Red.}} + \frac{RT}{nF} \ln \frac{a^a_{\text{Ox.}}}{a^b_{\text{Red.}}} a^m_{H^+}$$

If hydrogen ions do not participate in the given reaction, the expression assumes the following form:

$$E_{\text{Ox./Red.}} = E^0_{\text{Ox./Red.}} + \frac{RT}{nF} \ln \frac{a^a_{\text{Ox.}}}{a^b_{\text{Red.}}}$$

In all these formulas

E = electrode potential

E^0 = constant value which is characteristic of the given reaction (standard electrode potential)

R = gas constant

T = absolute temperature

n = number of electrons participating in the reaction

F = Faraday's constant (96 500 coulombs)

$a_{Me^{n+}}$, $a_{\text{Ox.}}$, $a_{\text{Red.}}$, a_{H^+} = activities of the components participating in the reaction

a, b, m = stoichiometric coefficients of the components participating in the reaction.

In going over from natural to common logarithms, we obtain (when $n = 1$)

$$E_{\text{Ox./Red.}} = E^0_{\text{Ox./Red.}} + \vartheta \log \frac{a^a_{\text{Ox.}}}{a^b_{\text{Red.}}} a^m_{H^+}$$

Table 34 (continued)

The values of ϑ, equal to $0.0591 + 0.0002\,(t - 25\,°C)$, are given in Table 34,A, for temperatures ranging from 0 °C to 50 °C.

When $a_{Ox.}$, $a_{Red.}$ and a_{H^+} or $a_{Me^{n+}}$ are equal to unity

$$E = E^0$$

In accepted usage, E^0 is called the standard electrode potential. The oxidation-reduction system is represented as a reduction reaction:

$$Ox. + ne \rightarrow Red. \quad \text{or} \quad Me^{n+} + ne \rightarrow Me\downarrow$$

The potential of a single isolated electrode cannot be measured, and therefore the electromotive force (emf) of an electrochemical cell consisting of two half-cells is measured; the value of the emf is equal to the difference of the electrode potentials of the two half-cells. If electrochemical cells are always formed with the same electrode whose potential remains constant and with various other electrodes, then upon measuring the emf, the value of the electrode potentials of the oxidation-reduction systems can be found relative to the potential of the selected electrode, which in the given case serves as a reference electrode (E_{ref}).

The standard hydrogen electrode (SHE) is used as a reference electrode. It consists of a platinized platinum electrode immersed into an acid solution having $a_{H^+} = 1$ (1N H_2SO_4 solution) at a pressure of purified hydrogen gas equal to 1 atm. The potential of the standard hydrogen electrode ($E^0_{H^+/H_2}$) is conventionally taken as zero at any temperature.

The standard potentials (E^0) of various oxidation-reduction (redox) systems relative to the potential of the standard hydrogen electrode are given in Table 40 (p. 300). The "+" and "—" signs of these potentials show the direction in which reaction occurs at the electrodes in question (provided that they are in the standard state) when they form a galvanic cell with a standard hydrogen electrode.

A minus (—) sign of the potential value indicates that the spontaneous reaction occurring at the electrode in question is the oxidation of the reduced form of the redox couple, and a plus (+) sign, the reduction of the oxidized form.

In practice, it is easier to work not with a hydrogen electrode, but with other reference electrodes whose potentials are constant and determined relative to E_{SHE}. Table 34,B (p. 268) gives the compositions and potentials (E_{ref}) of the most commonly used reference electrodes.

When calculating the electrode potential of a redox system (E_x) according to the result of the measurement of the emf of the galvanic cell in which the second electrode is one of the reference electrodes (see Table 34,B, p. 268), account must be taken of the sign of the electrode being examined. When the spontaneous reaction at the electrode in question is oxidation (i.e., when the electrode potential has a negative sign), then

$$\text{emf} = E_{ref} - E_x$$

Table 34 (continued)

or, conversely, when this reaction is reduction, then

$$\text{emf} = E_x - E_{ref}$$

Hence, in the first case,

$$E_x = E_{ref} - \text{emf}$$

and in the second,

$$E_x = E_{ref} + \text{emf}$$

For example, the measured emf of a galvanic cell consisting of a saturated reference calomel electrode ($E_{Sat.CE.} = 0.247$ V, see Table 35,B, p. 271) and a zinc electrode immersed in a solution (in which $a_{Zn^{2+}} = 1$) has an absolute value of 1.007 V. Since, in such a galvanic cell, the spontaneous reaction is the oxidation of metallic zinc ("—" sign):

$$Zn\downarrow - 2e \rightarrow Zn^{2+}$$

consequently:

$$E^0_{Zn^{2+}/Zn} = E_{ref} - \text{emf} = 0.247 - 1.007 = -0.760 \text{ V}$$

If an electrochemical cell consists of a saturated reference calomel electrode and a platinum electrode immersed into an iron salt solution having $a_{Fe^{3+}} = a_{Fe^{2+}} = 1$, then the emf value of this cell is $+0.524$ V. Since the spontaneous reaction at the electrode being considered is reduction ("+" sign), iron (III) is reduced to iron (II):

$$Fe^{3+} + e = Fe^{2+}$$

then

$$E^0_{Fe^{3+}/Fe^{2+}} = E_{ref} + \text{emf} = 0.247 + 0.524 = 0.771 \text{ V}$$

B. Composition and Potential of Selected Reference Electrodes Relative to the Standard Hydrogen Electrode (at 20 °C)

Reference electrode	Composition of reference electrode	Potential E_{ref}, V
Standard hydrogen electrode (SHE) Pt, H_2 | H^+ |	Platinized platinum plate in $1M$ H_2SO_4 solution, saturated with H_2 under a pressure of 1 atm	0.000
Mercuriodide electrode (MIE) Hg | HgI_2, KI, KCl |	Metallic mercury, 4.2 g of KI and 1.3 g of HgI_2 in 100 ml of saturated KCl solution	+0.02
Chlorosilver electrode (CSE) Ag | AgCl, Cl^- |	Metallic silver, coated with a layer of AgCl, in an HCl or KCl solution having the following concentrations:	
	0.1N	+0.290
	1.0N	+0.237
Calomel electrodes (CE) Hg | Hg_2Cl_2, KCl |	Metallic mercury, paste of metallic mercury and Hg_2Cl_2 in a KCl solution having the following concentrations:	
0.1 (0.1 SCE)	0.1N	+0.337
1.0 (SCE)	1.0N	+0.284
3.5 (3.5 SCE)	3.5N	+0.250
Saturated electrode (Sat.CE)	Saturated	+0.247
Mercurosulphate electrode (MSE) Hg | Hg_2SO_4, H_2SO_4 |	Metallic mercury, paste of metallic mercury and Hg_2SO_4 in $2N$ H_2SO_4 solution	+0.682

Table 35

Electrometric Determination of pH

The hydrogen ion exponent pH = $-\log a_{H^+}$. In the electrometric determination of the pH, the emf of one of the following cells is measured.

(1) Indicator electrode: hydrogen electrode; reference electrode: SHE*. Then,

$$\text{emf} = E_{\text{SHE}} - E_{2H^+/H_2}$$

Since $E_{\text{SHE}} = 0$ and

$$E_{2H^+/H_2} = \vartheta \log a_{H^+} = -\vartheta \text{pH}$$

then

$$\text{pH} = \frac{\text{emf}}{\vartheta}$$

(2) Indicator electrode: hydrogen electrode; reference electrode: one of the calomel electrodes (CE). Then,

$$\text{emf} = E_{\text{CE}} - E_{2H^+/H_2}$$

hence,

$$\text{emf} = E_{\text{CE}} + \vartheta \text{pH}$$

and

$$\text{pH} = \frac{\text{emf} - E_{\text{CE}}}{\vartheta}$$

(3) Indicator electrode: quinhydrone electrode; reference electrode: SHE. Then,

$$\text{emf} = E_{\text{quin./hydr.}} - E_{\text{SHE}}$$

$$E_{\text{quin./hydr.}} = E^0_{\text{quin./hydr.}} + \vartheta \log a_{H^+} = E^0_{\text{quin./hydr.}} - \vartheta\, \text{pH}$$

hence,

$$\text{emf} = E^0_{\text{quin./hydr.}} - \vartheta\, \text{pH} - E_{\text{SHE}}$$

Since $E_{\text{SHE}} = 0$, then

$$\text{pH} = \frac{E^0_{\text{quin./hydr.}} - \text{emf}}{\vartheta}$$

(4) Indicator electrode: quinhydrone; reference electrode: CE. Then,

$$\text{emf} = E^0_{\text{quin./hydr.}} - E_{\text{CE}}$$

hence

$$\text{emf} = E^0_{\text{quin./hydr.}} - \vartheta\, \text{pH} - E_{\text{CE}}$$

* Standard hydrogen electrode.

Table 35 (continued)

and

$$\mathrm{pH} = \frac{E^0_{\text{quin./hydr.}} - E_{\text{CE}} - \text{emf}}{\vartheta}$$

The values of $E^0_{\text{quin./hydr.}}$, E_{CE} and $E^0_{\text{quin./hydr.}} - E_{\text{CE}}$ at different temperatures are given in Table 35,A (p. 270), 35,B (p. 271) and 35,C (p. 272).

When the pH is being found by methods (3) and (4), account must be taken of what was said on p. 266. As the pH value increases, the $E_{\text{quin./hydr.}}$ potential decreases. The latter can decrease by so much that the spontaneous reaction at the quinhydrone electrode will be the oxidation of hydroquinone into quinone ("—" sign). Then, the calculating formulas change accordingly:

for method (3):

$$\text{emf} = E_{\text{SHE}} - E_{\text{quin./hydr.}} = -(E^0_{\text{quin./hydr.}} - \vartheta\,\mathrm{pH}) = \vartheta\,\mathrm{pH} - E^0_{\text{quin./hydr.}}$$

$$\mathrm{pH} = \frac{\text{emf} + E^0_{\text{quin./hydr.}}}{\vartheta}$$

for method (4):

$$\text{emf} = E_{\text{CE}} - E_{\text{quin./hydr.}} = E_{\text{CE}} - (E^0_{\text{quin./hydr.}} - \vartheta\,\mathrm{pH}) = E_{\text{CE}} + \vartheta\,\mathrm{pH} - E^0_{\text{quin./hydr.}}$$

$$\mathrm{pH} = \frac{\text{emf} + E^0_{\text{quin./hydr.}} - E_{\text{CE}}}{\vartheta}$$

Table 36

Change of pH in Precipitation of Metal Hydroxides (Approximate Values with Account Taken of the Formation of Hydroxocomplexes)*

Hydroxide	pH values				
	beginning of precipitation with the initial concentration of the ion being precipitated equal to		complete precipitation (residual concentration being less than 10^{-5} *M*)	beginning of dissolution of the precipitate (precipitation ceases to be complete)	complete dissolution of the precipitate
	1*M*	0.01*M*			
$Sn(OH)_4$	0	0.5	1	13	15
$TiO(OH)_2$	0	0.5	2.0	—	—
$Sn(OH)_2$	0.9	2.1	4.7	10	13.5
$ZrO(OH)_2$	1.3	2.25	3.75	—	—
HgO	1.3	2.4	5.0	11.5	—
$Fe(OH)_3$	1.5	2.3	4.1	14	—
$Al(OH)_3$	3.3	4.0	5.2	7.8	10.8
$Cr(OH)_3$	4.0	4.9	6.8	12	15
$Be(OH)_2$	5.2	6.2	8.8	—	—
$Zn(OH)_2$	5.4	6.4	8.0	10.5	12-13
Ag_2O	6.2	8.2	11.2	12.7	—
$Fe(OH)_2$	6.5	7.5	9.7	13.5	—
$Co(OH)_2$	6.6	7.6	9.2	14.1	—
$Ni(OH)_2$	6.7	7.7	9.5	—	—
$Cd(OH)_2$	7.2	8.2	9.7	—	—
$Mn(OH)_2$	7.8	8.8	10.4	14	—
$Mg(OH)_2$	9.4	10.4	12.4	—	—

* It should be noted that when hydroxides are being precipitated by an addition of an alkaline solution to a corresponding salt solution, a local growth in the pH value and the precipitate amount occur in places where the precipitant drops fall. Upon stirring, a back dissolution of the precipitate formed does not often take place (see Table 10 for various values of the solubility products of hydroxides during precipitation and after some ageing).

Table 37

Ionization Constants of Chief Acids and Bases

The table gives the thermodynamic ionization constants of acids and bases at 25 °C:

$$K_a = \frac{a_{H^+} a_{A^-}}{a_{HA}} = \frac{[H^+][A^-]}{[HA]} \times \frac{f_{H^+} f_{A^-}}{f_{HA}}$$

$$K_b = \frac{a_{Ct^+} a_{OH^-}}{a_{CtOH}} = \frac{[Ct^+][OH^-]}{[CtOH]} \times \frac{f_{Ct^+} f_{OH^-}}{f_{CtOH}}$$

where a_{H^+}, a_{A^-}, etc. = activities of ions or molecules
$[H^+]$, $[A^-]$, etc. = concentrations of ions or molecules
f_{H^+}, f_{A^-}, f_{Ct^+}, etc. = activity coefficients of ions or molecules.

Acids

Name	Formula	K_a	pK_a
Acetic	CH_3COOH	1.74×10^{-5}	4.76
Acid Chrome Black	*See* Table 28,		
Special K_1	No. 1 (p. 220)	5.0×10^{-7}	6.3
K_2		2.8×10^{-12}	11.55
Acrylic	$CH_2{=}CHCOOH$	5.5×10^{-5}	4.26
Adipic K_1	$HOOC(CH_2)_4COOH$	3.9×10^{-5}	4.26
K_2		5.1×10^{-6}	5.30
Aminoacetic (Glycine)	NH_2CH_2COOH	1.7×10^{-10}	9.78
α-Aminopropionic (α-Alanine)	$CH_3CH(NH_2)COOH$	1.35×10^{-10}	9.87

Table 37 (continued)

Name	Formula	K_a	pK_a

Table 38

Dissociation Constants of Complex Ions

The subscripts of K denote the number of groups of a ligand of a central atom of a complex which is dissociated by one step, for example, for Fe^{3+} complexes with chloride ions:

$$K_1 = \frac{[Fe^{3+}][Cl^-]}{[FeCl^{2+}]}; \qquad K_2 = \frac{[FeCl^{2+}][Cl^-]}{[FeCl_2^+]};$$

$$K_3 = \frac{[FeCl_2^+][Cl^-]}{[FeCl_3]}; \qquad K_4 = \frac{[FeCl_3][Cl^-]}{[FeCl_4^-]}$$

Two or more subscripts are written for complete dissociation constants of complexes with the corresponding number of groups of a ligand, for example:

$$K_{1,2} = \frac{[Fe^{3+}][Cl^-]^2}{[FeCl_2^+]}; \quad K_{1,2,3} = \frac{[Fe^{3+}][Cl^-]^3}{[FeCl_3]};$$

$$K_{1,2,3,4} = \frac{[Fe^{3+}][Cl^-]^4}{[FeCl_4^-]}$$

Evidently, $K_{1,2} = K_1 \cdot K_2$; $K_{1,2,3} = K_1 \cdot K_2 \cdot K_3$, etc. The table gives their indices, and not the constants themselves, i.e., the logarithms of the constants taken with an inverse sign:

$$pK_1 = -\log K_1; \; pK_2 = -\log K_2; \; pK_{1,2} = -\log K_{1,2}, \text{ etc.}$$

The indices of only complete dissociation constants are given; however, it follows from the above that the indices of the constants of separate dissociation steps can easily be found by the differences:

$$pK_2 = pK_{1,2} - pK_1; \quad pK_3 = pK_{1,2,3} - pK_{1,2}, \text{ etc.}$$

All data are given at temperatures of 20-30 °C.

Central ion	pK_1	$pK_{1,2}$	$pK_{1,2,3}$	$pK_{1,2,3,4}$	$pK_{1,2,3,4,5}$	$pK_{1,2,3,4,5,6}$	Ionic strength

Table 41

Chief Oxidation-Reduction Indicators

(in the order of their standard oxidation potentials)

A. Indicators not Sensitive to Changes in the pH and the Ionic Strength of a Solution

Indicator	Formula	Solution	$E°$, V	Colour of oxidized form	Colour of reduced form
2, 2′-Dipyridyl (complex *with ruthenium)*		In diluted HCl	+1.33	Colourless	Yellow
Nitro-o-phenanthroline (nitroferroin), complex with Fe^{2+}		0.025*M* solution in water	+1.25	Pale blue	Red $\lambda_{max} = 510$ nm
N-Phenyl-anthranylic acid		(a) 0.2% solution in water (b) 0.1% solution in 0.2% Na_2CO_3 solution	+1.08	Violet-red	Colourless

1,10-Phenanthroline (ferroin), complex with Fe^{2+}		0.025*M* solution; 1.624 g of phenanthroline hydrochloride and 0.695 g of $FeSO_4$ in 100 ml of water	+1.06	Pale blue	Red $\lambda_{max} = 510$ nm
p-Ethoxy chrysoidine		In water	+1.00	Red	Yellow
2, 2′-Dipyridyl (complex with Fe^{2+})		In diluted HCl	+0.97	Pale blue	Red
5,6-Dimethyl-1,10-phenanthroline (complex with Fe^{2+})		0.025*M* solution in water	+0.97	Yellow-green	Red
o-Dianisidine		In diluted HCl	+0.85	Red	Colourless

Table 41 (continued)

Indicator	Formula	Solution	$E°$, V	Colour of	
				oxidized form	reduced form
Sodium or barium diphenylamine sulphonate		0.05% solution in water	+0.84	Red-violet	Colourless
Diphenyl benzidine		1% solution in concentrated H_2SO_4	+0.76	Violet	Colourless
Diphenylamine		1% solution in concentrated H_2SO_4	+0.76	Violet	Colourless

B. Indicators Sensitive to a Change in the pH and the Ionic Strength of a Solution

Indicator	Formula	Solution	$E°$, V when the pH is equal to		Colour of	
			0	7	oxidized form	reduced form
2,6-Dibromobenzene indophenol (sodium salt)		0.02% solution in water	+0.64	+0.22	Blue	Colourless

2,6-Dichlorophenol indophenol (sodium salt)		0,02% solution in water	+0.64	+0.22	Blue	Colourless
o-Cresol indophenol (sodium salt)		0.02% solution in water	+0.62	+0.19	Blue	Colourless
Thionine (diaminophenothiazine; Lauth's violet)		0.05% solution in 60% alcohol	+0.56	+0.06	Violet	Colourless
Methylene blue		0.05% solution in water	+0.53	+0.01	Blue	Colourless

Table 41 (continued)

Indicator	Formula	Solution	E°, V, when the pH is equal to 0	E°, V, when the pH is equal to 7	Colour of oxidized form	Colour of reduced form
Indigo tetrasulphonic acid		0.05% solution in water	+0.37	—0.05	Blue	Colourless
Indigo trisulphonic acid		0.05% solution in water	+0.33	—0.08	Blue	Colourless
Indigo carmine (indigo disulphonic acid)		0.05% solution in water	+0.29	—0.13	Blue	Colourless

Indigo monosulphonic acid		0.05% solution in water	+0.26	—0.16	Blue	Colourless
Phenosafranine		0.05% solution in water	+0.28	—0.25	Red	Colourless
Safranine T		0.05% solution in water	+0.24	—0.29	Violet-red	Colourless
Neutral red	*See* Table 19, No. 43 (p. 189)	0.01% solution in 60% alcohol	+0.24	—0.33	Red	Colourless

Table 42

Spectral Wavelengths and Colours Corresponding to Them

Ranges of the wavelengths of the light being absorbed, nm	Colour of the radiation being absorbed	Supplementary colour (observed colour of solution)
400-450	Violet	Yellow-green
450-480	Blue	Yellow
480-490	Green-blue	Orange
490-500	Blue-green	Red
500-560	Green	Purple
560-575	Yellow-green	Violet
575-590	Yellow	Blue
590-625	Orange	Green-blue
625-750	Red	Blue-green

Table 43

Photometric Methods of Determining Various Ions

Ion being determined	Reagent	Solvent	pH or acidity	λ_{max}, nm	Molar coefficient of light absorption $\varepsilon \cdot 10^{-3}$
Al^{3+}	Aluminon	Water	4.5	525	24
	Arsenazo	Water	—	600	13.0
	Morin	95% alcohol	—	415	18
	Hydroxyquinoline	Chloroform	4.35-4.5	405	4.9
				260	80
	Stilbazo	Water	5.4	500	19.5
	Eriochrome cyanine R	Water	4-6	530	40
Ag^{+}	Dithizone	Carbon tetrachloride	H_2SO_4, 0.5*N*	462	30.5
	Diethyl dithiocarbamate	Carbon tetrachloride	2.6-5	340	5.4
	Rhodanine (*p*-dimethylaminobenzylidene rhodanine)	Water + ethanol, 4% by volume	1.3	595	23.2
As^{3+}	Diethyl dithiocarbamate	Carbon tetrachloride	3-6	340	3.6
AsO_4^{3-}	Ammonium molybdate + + hydrazine sulphate	Water	1-1.3	840	25
	Sodium molybdate	Butanol	HCl, diluted (1 : 3)	370	5.1
	Sodium molybdate + + sodium vanadate	Water	HCl, 1*N*	400	2.5

Table 43 (continued)

Ion being determined	Reagent	Solvent	pH or acidity	λ_{max}, nm	Molar coefficient of light absorption $\varepsilon \cdot 10^{-3}$
$AuBr_4^-$	Hydrobromic acid	Water	~ 1	380	4.8
$AuCl_4^-$	Rhodamine B	Benzene	HCl, 1*N*	565	97
	Methyl violet	Trichloroethylene	HCl, 1*N*	600	115
B^{3+}	Brilliant green + HF	Benzene	?	?	20
	Carminic acid	H_2SO_4, concentrated	—	585	?
	Curcumin	Ethanol, methanol or acetone	—	555	180
	Curcumin + oxalic acid	Ethanol	—	540	40
	Methylene blue + HF	Dichloroethane	?	645	14
	Quinalizarin	H_2SO_4, concentrated	—	620	?
Be^{2+}	Acetylacetone	Chloroform	7	295	31.6
	Aluminon	Water	7.6	535	2.2
	Beryllon	Water	12-13.2	600	4.0
	Eriochrome cyanine R	Water	9.8	512	?
Bi^{3+}	Dithizone	Carbon tetrachloride	6	490	80
	Diethyl dithiocarbamate	Carbon tetrachloride	7-10	400	6.3
	Potassium iodide	Isoamyl alcohol	H_2SO_4, 1*N*	450	6.5
	Potassium iodide	Water	H_2SO_4, 1*N*	337	34
	Complexone III	Water	4.5	264	9.4
	Hydroxyquinoline	Chloroform	4-5.2	395	11
	Hydrochloric acid, 6*N*	Water	—	327	14.9
	Thiourea	Water	HNO_3, 0.4-1.2*N*	470	8.8
				322	35

Br^-	Rosaniline	Benzyl alcohol	H_2SO_4, 18*N*	585	68
	Hypochlorite + H_2SO_4	Carbon tetrachloride	H_2SO_4, 2*N*	415	0.2
CN^-	Pyridine + benzidine	Water	—	520	69
	Pyridine + sulphanilic acid	Water	—	450	62
	Pyridine + barbituric acid	Water	—	584	124
Ca^{2+}	Azo-azoxy BN	Carbon tetrachloride	NaOH, 1*N*	485	20
	Arsenazo III	Water	6.5	655	10
	Phthalein complexone	Water	10-11	575	30
	Murexide	Water	11.3	506	11.3
Cd^{2+}	Dithizone	Carbon tetrachloride	4-12	520	88
	Diethyl dithiocarbamate	Carbon tetrachloride	9	440	0.21
	Cadion + acetone	Water	9.4	490	13
Ce^{3+}	Arsenazo III	Water	3.0	665	47
	Hydroxyquinoline	Chloroform	10	480	2
Ce^{4+}	Colour of ions themselves	Water	H_2SO_4, 1*N*	320	5.6
Cl^-	Hg^{2+} + diphenyl carbazone	Water	3.2	520	9.5
Cl_2	*o*-Tolidine	Water	1.6	438	26.5
Co^{2+}	Arsenazo	Water	—	600	25
	Dithizone	Carbon tetrachloride	6-8	542	59.2
	Diethyl dithiocarbamate	Chloroform	6.3	650	0.5
	α-Nitroso-β-naphthol	Chloroform	4-5.5	317	26.5
		Benzene	—	416	30

Table 43 (continued)

Ion being determined	Reagent	Solvent	pH or acidity	λ_{max}, nm	Molar coefficient of light absorption $\varepsilon \cdot 10^{-3}$
Co^{2+}	β-Nitroso-α-naphthol	Water	NH_3, 0.15*N*	550	7.5
		Toluene	~3	530	26

Table 45

Extraction with Organic Solvents

A. Extraction of Various Elements in the Form of Dithizonates (Dr: dithizone ion)

Reagent—dithizone solution in chloroform or carbon tatrachloride; E—extracted by both organic solvents; N—cannot be extracted; N-E—weakly extracted

Element	Complex	Colour	Maximum light absorption λ, nm	Solubility in $CHCl_3$ or CCl_4	pH of extraction solution	Remarks
Ag^+	AgHDz	Yellow	460	E	Diluted mineral-acid solution	—
	Ag_2Dz	Violet-red	—	N	Alkaline solution	Insignificantly soluble in $CHCl_3$ (red solution)
Au^{3+}	$Au(HDz)_3$	Yellow	450	E	Diluted mineral-acid solution	Solutions are sensitive to light. Direct extraction titration and the photometric method are used
	Au_2Dz_3	Red-brown	—	E	Alkaline solution	Dissolves weakly in CCl_4. Solutions are sensitive to light. Direct extraction titration alone is used
Bi^{3+}	$Bi(HDz)_3$	Orange	490 and 275	E	>2 (CCl_4)	—
	Bi_2Dz_3	Orange-red	505	E	Alkaline solution	Reacts likewise in the presence of KCN
Cd^{2+}	$Cd(HDz)_2$	Red	520	E	Alkaline solution	Stable when being shaken with 1N NaOH solution

Co^{2+}	$Co(HDz)_2$	Violet-red	542	E	7-9 (CCl_4)	The dithizonate solution in an organic solvent is quite stable relative to diluted mineral acids
	CoDz(?)	Brown	—	E	Strong alkaline solution	Decomposition products may appear
Cu^{+}	CuHDz	Violet, the solution in CCl_4 is brown	—	E	Diluted mineral-acid solution (~0.1N)	—
	Cu_2Dz	Red-brown	—	E	Alkaline solution	Only insignificantly soluble in CCl_4
Cu^{2+}	$Cu(HDz)_2$	Violet-red	545-550	E	Diluted mineral-acid solution	The determination according to mixed colour should be made when $\lambda = 510$ nm or 625 nm
	CuDz	Yellow-brown	450	E	Alkaline solution	Can form also in a weak acid solution when copper ions are in the presence of excessive dithizone
Fe^{2+}	$Fe(HDz)_2$	Red	520	E	7-9 (CCl_4)	Fe^{III} does not form a complex, but it oxidizes dithizone in an alkaline medium, especially in the presence of cyanide
Hg_2^{2+}	$Hg_2(HDz)_2$	Orange	—	E	Diluted mineral-acid solution	—
	Hg_2Dz	Purple	485	N-E	Alkaline solution	—

Table 45 (continued)

Element	Complex	Colour	Maximum light absorption λ, nm	Solubility in $CHCl_3$ or CCl_4	pH of extraction solution	Remarks
Hg^{2+}	$Hg(HDz)_2$	Orange-yellow	485	E	Diluted mineral-acid solution	Can form in a weak alkaline solution with dithizone excess. Sensitive to light. The determination according to mixed colour should be made when $\lambda = 500$ nm or 610 nm
Hg^{2+}	$HgDz$	Red	520	E	Alkaline solution	Can form in a weak acid solution when there is a dithizone insufficiency
In^{3+}	$In(HDz)_3$	Red	510	E	5-6 (CCl_4); 8.3-9.6 ($CHCl_3$)	Reacts likewise in the presence of cyanide
Mn^{2+}	$Mn(HDz)_2$	Violet-brown	—	$CHCl_3$	~10	Solution is very unstable; brown flakes precipitate when CCl_4 substitutes $CHCl_3$
Ni^{2+}	$Ni(HDz)_2$	Brown-violet (when extracted from strong alkaline solutions, it is gray)	285, 480, 665	E	Weak alkaline solution	When CCl_4 is used, nickel dithizonate dissolved in it is decomposed by mineral acids with difficulty
Pb^{2+}	$Pb(HDz)_2$	Carmine red	520	E	8.5-11 (optimal in $CHCl_3$)	The presence of CN^- does not inhibit reaction

Pd^{2+}	$Pd(HDz)_2$	Brownish green; the solution in $CHCl_3$ is pale green	280, 640	E	—	Can be obtained by adding dithizone to a PdDz solution. Stable in respect of 6*N* NaOH and 6*N* H_2SO_4. The determination according to mixed colour is made when $\lambda = 620$ nm and 280 nm
	PdDz	Brownish red	—	N-E	Diluted mineral-acid solution	In organic solvents, it is soluble only partially, forming a dark-violet solution. Reaction occurs slowly
Pt^{2+}	$Pt(HDz)_2$	Brown-yellow	710, 490 and 260	CCl_4	HCl, 1.5-3*N*	Reaction is effected in the presence of $SnCl_2$; violet flakes occasionally appear. Platinous dithizonate is insoluble in $CHCl_3$. Platinum (IV) and other tetravalent and trivalent platinum metals do not react
Sn^{2+}	$Sn(HDz)_2$	Red	520	E	>4 (optimal 6-9) (CCl_4)	Unstable
Tl^{+}	TlHDz	Orange-red	505	E	11-14.5	Forms likewise in the presence of CN^-
Zn^{2+}	$Zn(HDz)_2$	Purple	535	E	Neutral or weak alkaline solution (optimal at pH = = 8.3 in a citrate buffer solution by the extraction with $CHCl_3$)	With dithizone excess, complete reaction occurs also in a weak acid medium. The presence of thiosulphate does not inhibit reaction

Table 45 (continued)

Action of Masking Agents during Extraction in the Form of Dithizonates

Extraction conditions	Elements reacting with dithizone
Alkaline solution containing cyanide	Pb^{2+}, Sn^{2+}, Tl^{+}, Bi^{3+}
Weak acid solution containing cyanide	Pd^{2+}, Hg^{2+}, Ag^{+}, Cu^{2+}
Diluted acid solution containing rhodanide	Hg^{2+}, Au^{3+}, Cu^{2+}
Diluted acid solution containing rhodanide and cyanide	Hg^{2+}, Cu^{2+}
Diluted acid solution containing bromide or iodide	Pb^{2+}, Au^{3+}, Cu^{2+}
Diluted acid solution containing ethylenediaminetetraacetate	Hg^{2+}, Ag^{+}
Weak acid solution ($pH = 5$) containing thiosulphate (dithizone is dissolved in CCl_4)	Pd^{2+}, Sn^{2+}, Zn^{2+} (Cd^{2+}, Co^{2+}, Ni^{2+})
Weak acid solution ($pH = 4$-5) containing thiosulphate and cyanide	Zn^{2+}, Sn^{2+}
Citrate and tartrate in an alkaline medium	Usually does not inhibit dithizonate extraction

B. Extraction of Various Elements in the Form of Diethyl Dithiocarbamates

Element	Optimal pH values in extraction	Extractant and extraction conditions
Ag^{+}	3	Ethyl acetate
	4-11	Carbon tetrachloride
As^{III}	4-5.6	ditto
Bi^{3+}	1-10	Chloroform, diethyl ether, ethyl acetate
	11-12	Carbon tetrachloride in the presence of ethylenediaminetetraacetate and KCN

Cd^{2+}	3	Ethyl acetate
	11-12	Carbon tetrachloride in the presence of KCN
Co^{2+}	6-8	Chloroform
Cr^{VI}	0-6	ditto
Cu^{2+}	1-3.5	ditto
	Alkaline solution	Ethyl acetate in the presence of ethylenediaminetetraacetate; the subsequent acid treatment allows separation from other elements being extracted under these conditions
Fe^{2+}	4-11	Carbon tetrachloride
Fe^{3+}	0-10	Chloroform
Ga^{3+}	3	Ethyl acetate (a reagent excess is required)
Hg^{2+}	3	Ethyl acetate
	11	Carbon tetrachloride in the presence of ethylenediaminetetraacetate
In^{3+}	3	Ethyl acetate
	9	Carbon tetrachloride in the presence of KCN
Mn^{2+}	6.5	Ethyl acetate (a reagent excess is required)
	7.5-8.0	Chloroform in the presence of citrate
Mo^{VI}	3	Ethyl acetate
Nb^{V}	4-5.5	Carbon tetrachloride
	0-10	Chloroform, ethyl acetate
Ni^{2+}	2.2	Chloroform
Os^{VI}	7-9 (extraction is slow and incomplete)	Carbon tetrachloride
Pb^{2+}	Strong acid solution	Diethyl ether, ethyl acetate
	11	Carbon tetrachloride in the presence of KCN
Pd^{2+}	11	Carbon tetrachloride in the presence of ethylenediaminetetraacetate

Table 45 (continued)

Element	Optimal pH values in extraction	Extractant and extraction conditions
Re^{VI}	HCl, concentrated	Ethyl acetate
Sb^{III}	4-9.5	Carbon tetrachloride
Se^{IV}	5-6	ditto
Sn^{IV}	5-6	ditto
Te^{IV}	3	Ethyl acetate
	$5N$ H^+-3.3	Chloroform, benzene
	8.5-8.8	Carbon tetrachloride in the presence of ethylenediaminetetraacetate and KCN
Tl^+	3	Ethyl acetate (a reagent excess is required)
Tl^{3+}	11	Carbon tetrachloride in the presence of ethylenediaminetetraacetate and KCN
U^{VI}	6.5-8.5	Chloroform, amyl acetate, diethyl ether
V^V	3	Ethyl acetate
	4.5-5.0	Chloroform
	0.4-0.5	Amyl acetate in the presence of tartaric acid
	1-1.5	Ethyl acetate
W^{VI}	11	Carbon tetrachloride
Zn^{2+}	Weak alkaline solution	Diethyl ether, chloroform

Action of Masking Agents during Extraction in the Form of Diethyl Dithiocarbamates

Extraction conditions	Elements reacting with diethyl dithiocarbamate
In the presence of ethylenediaminetetraacetate at pH 11	Ag^+, Bi^{3+}, Cu^{2+}, Hg^{2+}, Pd^{2+}, Tl^{3+}
In the presence of KCN at pH 9	Bi^{2+}, In^{3+}, Mn^{2+}, Sb^{3+}, Te^{IV}, Tl^{3+}
Likewise at pH 11	Bi^{3+}, Cd^{2+}, Pb^{2+}, Tl^{3+}
In the presence of ethylenediaminetetraacetate and KCN at pH 9	Bi^{3+}, Sb^{3+}, Te^{IV}, Tl^{3+}
Likewise at pH 11	Bi^{3+}, Tl^{3+}

C. Extraction of Various Elements in the Form of Cupferronates

Element	Optimal conditions of extraction	Extractant
Al^{3+}	pH 2-5	Chloroform
Bi^{3+}	HCl, H_2SO_4	Toluene, methyl ethyl ketone
Cd^{2+}	Neutral solution	Boiling diethyl ether
Ce^{4+}	pH 2	Butyl acetate
Co^{2+}	CH_3COOH, diluted	Ethyl acetate or diethyl ether
Cu^{2+}	HCl, diluted (1 : 9)	Chloroform
Fe^{3+}	H_2SO_4 or HCl, diluted (1 : 9)	Chloroform, diethyl ether, ethyl acetate
Ge^{IV}	Weak acid solution	Methyl isobutyl ketone
Hg^{2+}	Neutral solution	Benzene, chloroform
In^{3+}	Diluted acid	ditto
Mn^{2+}	Neutral solution	Diethyl ether
Mo^{VI}	HCl, diluted (2 : 9)	Ethyl acetate, chloroform
Nb^{V}	Acid solution	Chloroform
Ni^{2+}	Neutral solution	Various organic solvents
Pa	1-4*N* acid	Benzene, diethyl ether, chloroform
Sb^{III}	H_2SO_4, diluted (1 : 9)	Chloroform
Sn^{2+}	1.5*N* acid	Benzene, chloroform
	Crystal violet + $TiCl_3$	4-Heptanone
Sn^{IV}	HCl, diluted (1 : 9)	Ethyl acetate
Th^{IV}	HCl, diluted (1 : 9)	Ethyl acetate, butyl acetate
	pH 0.3-0.8	Benzene + isoamyl alcohol
Ti^{IV}	HCl, diluted (1 : 9)	Chloroform, ethyl acetate
	Ammonium tartrate, pH 5	Isoamyl alcohol
U^{IV}	H_2SO_4, diluted (1 : 9)	Diethyl ether
V^{V}	HCl or H_2SO_4, diluted (1 : 9)	Ethyl acetate or ether
W^{VI}	HCl, diluted (1 : 9)	Ethyl acetate (incomplete extraction)
Zn^{2+}	Neutral solution	Diethyl ether (incomplete extraction)
Zr^{IV}	H_2SO_4, diluted (1 : 9)	Ethyl acetate
	pH 0.3-1.0	Benzene + isoamyl alcohol

Table 45 (continued)

D. Extraction of Various Elements in the Form of Hydroxyquinolates
(1% hydroxyquinoline solution in chloroform)

Element	Optimal pH values in extraction	Extractant and extraction conditions
Al^{3+}	4.8-6.7; 8.2-11.5	—
Bi^{3+}	4.0-5.2	—
Ca^{2+}	13	Butyl cellosolve + chloroform
	11.5	Chloroform or, better, 0.2*M* butylamine solution in chloroform
Cd^{2+}	8	Incomplete extraction
Ce^{3+}	9.9-10.5	The presence of KCN is permissible
Co^{2+}	>6.8	—
Cu^{2+}	2.8-14	At high pH values, tartrate is added
Er^{3+}	>8.5	—
Fe^{3+}	1.9-12.5	At high pH values, tartrate is added
Ga^{3+}	3.0-6.2	—
In^{3+}	>3.0	—
Mg^{2+}	10-10.2	Butyl cellosolve + chloroform
	10.5-13.6	0.2*M* butylamine solution in chloroform
Mn^{2+}	12.5	In the presence of tartrate and hexacyanoferrate (II)
Mo^{VI}	1.6	Likewise in the presence of ethylenediaminetetraacetate
Nb^{V}	NH_4OH, 1*N*	Citrate medium
Nd^{3+}	>8.5	—
Ni^{2+}	4.5-9.5	—
Pa^{+}	$(NH_4)_2CO_3$, saturated solution	Incomplete extraction
Pb^{2+}	8.4-12.3	—

Pd^{2+}	HCl, diluted	—
Pu^{IV}	4-8	Amyl acetate
Ru^{III}	Acetate medium	—
Sc^{3+}	9.7-10.5	Benzene
Sn^{IV}	2.5-5.5	—
Sr^{2+}	11.3	1*M* hydroxyquinoline solution in chloroform
Th^{IV}	4.9	Chloroform or methyl isobutyl ketone
Ti^{IV}	3.8-5.0	In the presence of hydrogen peroxide
	8-9	In the presence of ethylenediaminetetraacetate
Tl^{3+}	6.5-7.0	85-89% is extracted
U^{VI}	4.7-8.0	—
	8.8	In the presence of ethylenediaminetetraacetate
V^{V}	3.3-4.5	—
	5.0	In the presence of an ethylenediaminetetraacetate complex with calcium ions
W^{VI}	2.4	In the presence of ethylenediaminetetraacetate
Zn^{2+}	4.6-13.4	Incomplete extraction
	Acetate buffer	—

Action of Masking Agents during Extraction in the Form of Hydroxyquinolates

Extraction conditions	Elements reacting with 8-hydroxyquinoline
In the presence of ethylenediaminetetraacetate, at pH 8 and higher, masking of Al^{3+}, Co^{2+}, Fe^{3+}, Mn^{2+} and Ni^{2+} occurs	
At pH 7.9-9.0	Ti
At pH 2.5-9.0	Cu

Table 45 (continued)

E. Extraction of Various Elements from Hydrochloric, Hydrobromic, Hydroiodic and Nitric Acids by an Equal Volume of Diethyl Ether

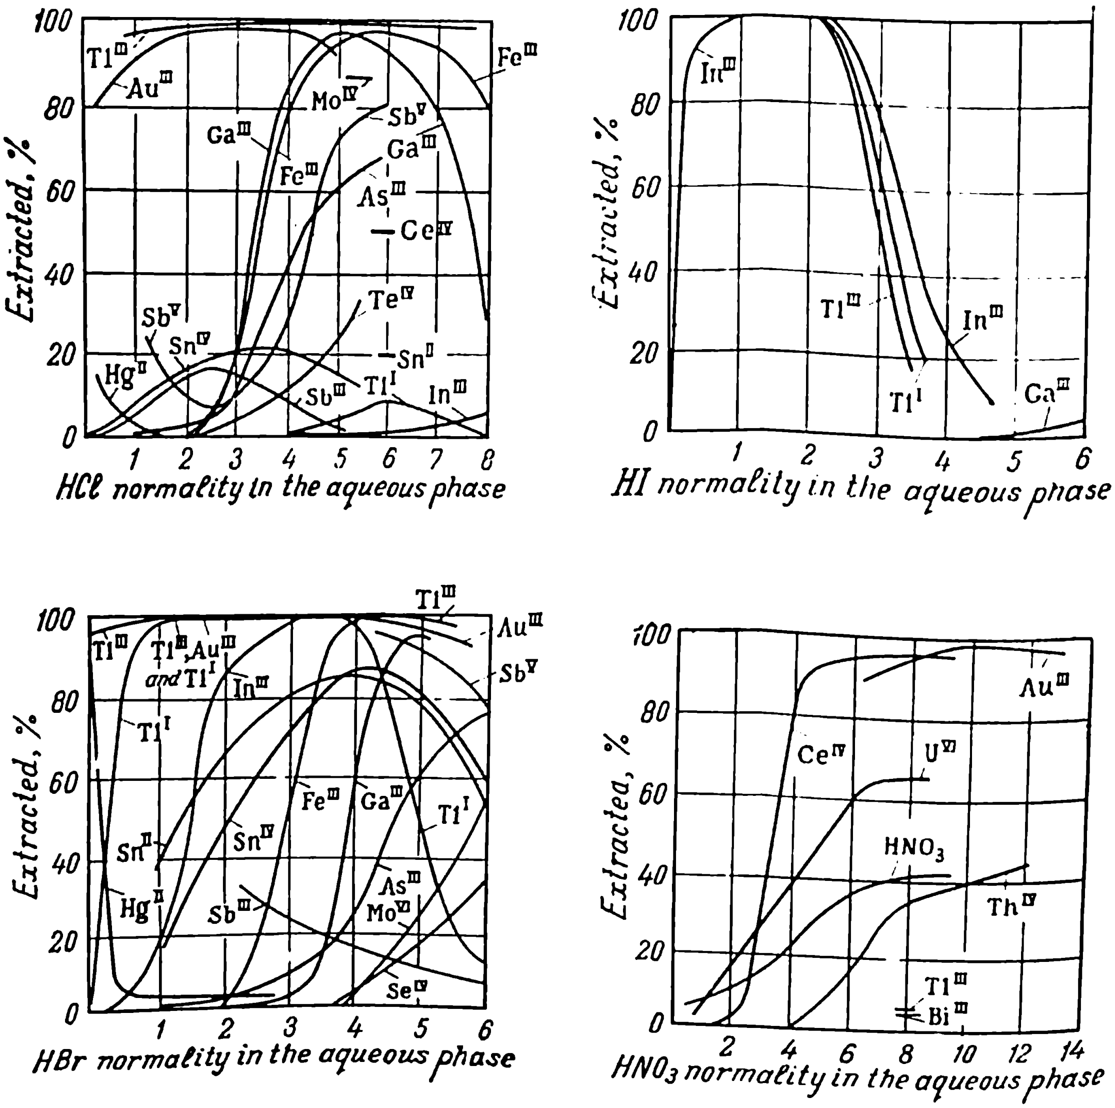

Table 46

Separation of Organic Compounds

A. Classification of Individual Compounds According to Their Behaviour under the Action of Some Reagents

A test of the examined compound is consecutively treated with the following reagents: (a) distilled water, (b) diethyl ether, (c) $1.2N$ hydrochloric acid, (d) $1.5N$ sodium bicarbonate solution, (e) $2.5N$ caustic soda solution, (f) concentrated sulphuric acid, and (g) 85% phosphoric acid.

These reagents are used to treat separate portions of the test in the given order. A test is considered to be soluble in one reagent or another if it dissolves upon shaking for two minutes at room temperature in a quantity which is 30 times greater in mass than the given reagent.

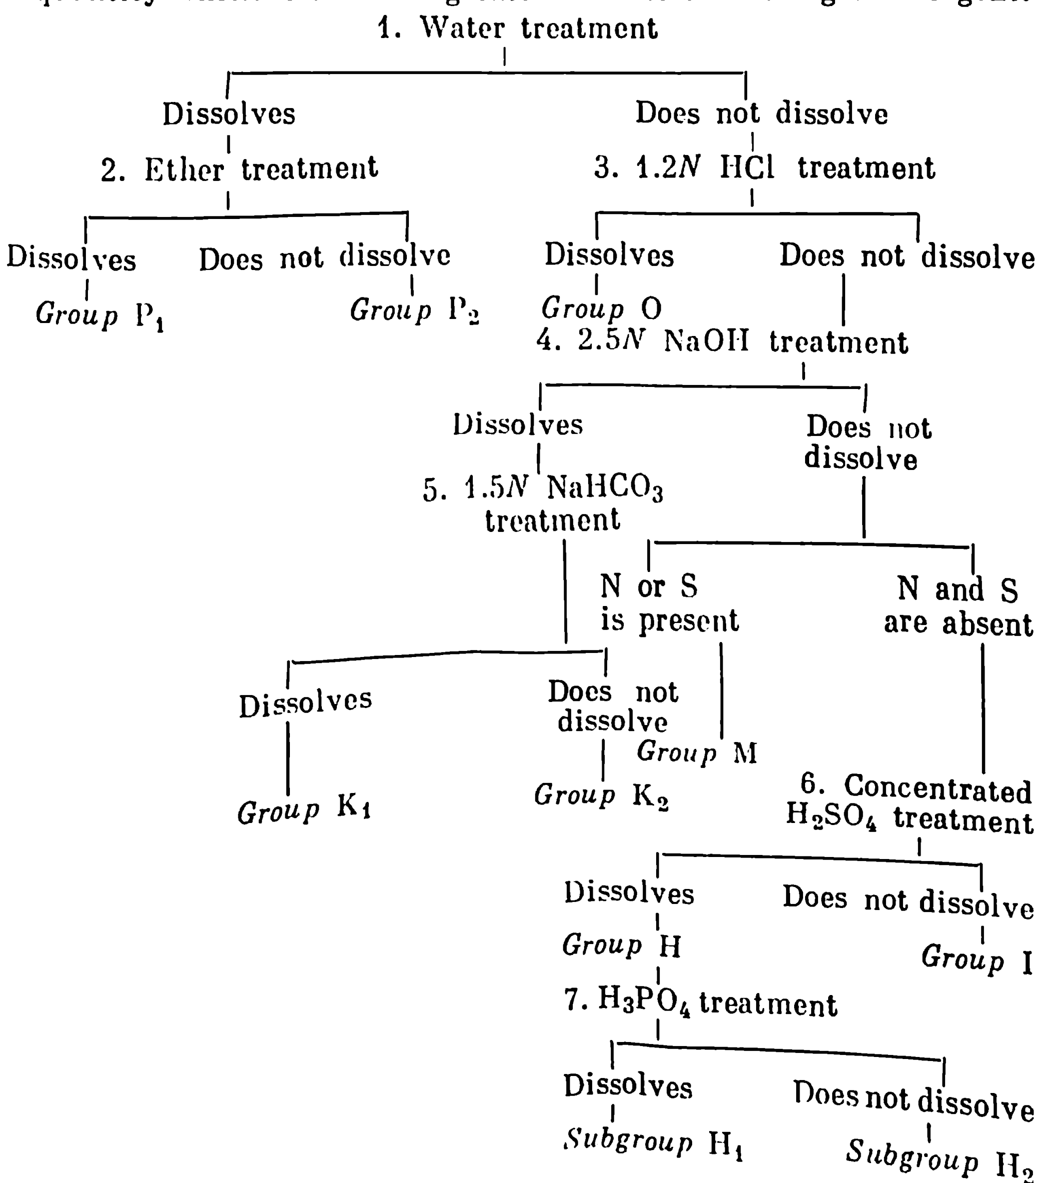

Table 46 (continued)

B. Composition of Groups (see Table 46,A)
(the chief compounds of every group are italicized)

Group P_1

Mainly monofunctional compounds with five or less carbon atoms in a molecule.

1. Presence of only C, H and O
   - *Alcohols*
   - *Aldehydes and ketones*
   - *Carboxyl acids*
   - Acetals
   - Anhydrides
   - Ethers and esters
   - Some glycols
   - Lactones
   - Phenols (partially)
2. Presence of N
   - *Amides*
   - *Amines*
   - Heterocyclic amines
   - Nitriles
   - Nitroparaffins
   - Oximes
3. Presence of a halogen
   - Halogen-substituted compounds of subgroup I
4. Presence of S
   - Oxyheterocyclic S-compounds
   - Mercapto acids
   - Thioacids
5. Presence of N and halogens
   - Halogenated amines, amides, nitriles
6. Presence of N and S
   - Aminoheterocyclic compounds

Group P_2

Substances having an average molecular weight, with two or more polar groups (except for sulphonic and sulphinic acids, which belong to the P_2 group, although they have only one polar group in a molecule).

1. Presence of only C, H and O
   - *Dibasic and polybasic acids*
   - *Hydroxyacids*
   - *Polybasic alcohols*
   - *Polybasic phenols*
   - Simple carbohydrates
2. Presence of metals
   - *Acid and phenol salts*
   - Various metal-containing compounds
3. Presence of N
   - *Amine and organic-acid salts*
   - *Amino acids*
   - *Ammonium salts*
   - Amides
   - Amines
   - Amino alcohols
   - Semicarbazides
   - Semicarbazones
   - Ureas
4. Presence of halogens
   - *Halogen acids*
   - Acyl halogenides (as a result of hydrolysis)
   - Halogen alcohols, halogen aldehydes, etc.
5. Presence of S
   - *Sulphonic acids*
   - Alkyl sulphonic acids
   - Sulphinic acids
6. Presence of N and a halogen
   - Amine and halogen-acid salts
7. Presence of N and S
   - Aminodisulphinic acids
   - Hydrosulphates of weak bases
   - Cyanosulphonic acids
   - Nitrosulphonic acids

Table 46 (continued)

Group O: Bases

Diaryl- and triaryl-amines, and also carbazols, belong to the M group. In addition to the listed below the O group includes a small number of oxygen-containing compounds which form oxonium salts when treated with HCl.

Amines (Amines with sufficiently strong negative components belong to the M group)
Amino acids
Amphoteric compounds (aminophenols, aminothiophenols, aminosulphoamides)
Aryl-substituted hydrazines
N-Dialkylamides

Group A_1: Strong Acids

1. Presence of only C, H and O
   Acids (usually, the number of carbon atoms in a molecule is less than 10)
2. Presence of N
   Amino acids
   Nitro acids
   Cyano acids
   Heterocyclic nitric and carboxylic acids
   Polynitrophenols
3. Presence of S
   Sulphonic acids
   Sulphinic acids
4. Presence of halogen
   Halogen acids
   Polyhalogenophenols
5. Presence of N and S
   Aminosulphonic acids
   Nitrothiophenols
   Sulphates of weak bases
6. Presence of S and halogens
   Sulphohalogenides

Group A_2: Weak Acids

1. Presence of only C, H and O
   Acids (high-molecular)
   Anhydrides
   Phenols (including esters of phenol acids)
   Enols
2. Presence of N
   Nitrophenols
   Amides (including N-monoalkylamides)
   Aminophenols
   Amphoteric compounds
   Cyanophenols
   Imides
   N-Monoalkyl aromatic amines
   N-Substituted hydroxylamines
   Amino acids
   Oximes
   Nitroparaffins, primary and secondary
   Trinitro aromatic hydrocarbons
   Ureides
3. Presence of halogens
   Halogenophenols
4. Presence of S
   Mercaptanes
   Thiophenols
5. Presence of N and halogens
   Polynitrohalogenated aromatic hydrocarbons
   Substituted phenols
6. Presence of N and S
   Aminosulphonamides
   Aminosulphonic acids
   Aminothiophenols
   Sulphamides
   Thioamides

Table 46 (continued)

Group M

Neutral compounds containing nitrogen or sulphur. Only a few of them are distilled with vapour.

(Only the most common classes are given)

1. Presence of N
   - *Anilides and toluidides*
   - *Amides*
   - *Nitroarylamines*
   - *Nitro hydrocarbons*
   - Aminophenols
   - Azo, hydrazo and azoxy compounds
   - Di- and tri-arylamines
   - Dinitrophenyl hydrazines
   - Nitrates
   - Nitrites
2. Presence of S
   - Mercaptanes
   - N-Dialkyl sulphoamides
   - Sulphates, sulphonates
   - Sulphides, disulphides
   - Sulphones
   - Thioethers
   - Thiourea derivatives
3. Presence of N and S
   - Sulphamides
4. Presence of N and halogen
   - Halogenated amines, amides, nitriles

Group H

Neutral compounds not containing nitrogen and sulphur. Distilled off with vapour. The H_1 subgroup includes compounds containing not more than 7-8 carbon atoms in a molecule; the H_2 subgroup contains the remaining compounds of this group.

Alcohols
Aldehydes and ketones
Esters
Ethers
Unsaturated hydrocarbons
(Acyclic unsaturated hydrocarbons and the cyclic unsaturated hydrocarbons which easily sulphurize)
Acetals
Anhydrides
Lactones
Polysaccharides (they carbonize in concentrated H_2SO_4)

Group I: Inert Compounds

Hydrocarbons (including most cyclic hydrocarbons and all saturated acyclic hydrocarbons)
Halogen derivatives of hydrocarbons
Diaryl ethers

Table 46 (continued)

C. Various Organic Compounds Belonging to the Main Groups

Compound	Group	Compound	Group
Acids		1,2,3,5-Tetramethyl benzene (Isodurene)	H_2
n-Butyric	P_1	1,3,5-Trimethyl benzene (Mesitylene)	H_2
Chloroacetic	P_1	*m*-Xylene	H_2-I
α-Chloropropionic	P_1	*o*-Xylene	H_2-I
Crotonic	P_1	*p*-Xylene	H_2-I
Isovaleric	P_1-K_1	*Amines*	
Valeric	K_1	*n*-Amylamine	P_1
Alcohols		Aniline	O
tert-Amyl	P_1	Benzylamine	P_1
Benzyl	H_1	Diethylamine	P_1
n-Butyl	P_1	Di-*n*-butylamine	O
Cyclopentanol	H_1	Di-*n*-propylamine	P_1-O
Isoamyl	P_1-H_1	Isoamylamine	P_1
Isopropyl methyl carbinol	P_1-H_1	Piperidine	P_1
Aldehydes		Tri-*n*-propylamine	O
n-Butyric	P_1-H_1	*Esters*	
Isobutyric	P_1	Benzyl acetate	H_1
Isovaleric	H_1	*n*-Butyl acetate	H_1
Amides		*sec*-Butyl acetate	H_1
Acetamide	P_1-P_2	*n*-Butyl carbonate	H_1-H_2
Acetanilide	M	*n*-Butyl formate	P_1-H_1
Butyramide	P_1-M	*n*-Butyl oxalate	H_2
Formamide	P_1-P_2	Ethyl acetate	P_1-H_1
Formanilide	P_1-M	Ethyl benzoate	H_2
Isobutyramide	P_1-P_2	Ethyl caprylate	H_2
Propionamide	P_1-P_2	Ethyl carbonate	P_1-H_1
Ethers		Ethyl malonate	H_2
n-Butyl	H_2	Ethyl oxalate	P_1-H_1
Diethyl	P_1-H_1	Ethyl phthalate	H_1
Diisopropyl	H_1	Ethyl succinate	H_1
Ethyl isopropyl	P_1-H_1	Isopropyl acetate	P_1
Ethyl methyl	P_1	Methyl carbonate	P_1-H_1
Aromatic hydrocarbons		Methyl isobutyrate	P_1-H_1
Cymene	I	Methyl isovalerate	H_1
Diphenyl methane	H_2-I	Methyl malonate	P_1-H_1
Naphthalene	I	Methyl propionate	P_1

Table 46 (continued)

Compound	Group	Compound	Group
n-Propyl acetate	P_1-H_1	Methyl-*n*-propyl ketone	P_1-H_1
n-Propyl formate	P_1	Pinacoline	P_1-H_1
Nitriles		Succinonitrile	P_1-P_2-M
n-Butyronitrile	M	Trimethylene cyanide	P_2-M
Isobutyronitrile	P_1-M	*Nitro compounds*	
Propionitrile	P_1	Nitrobenzene	M
Ketones		Nitroethane	K_2
Acetophenone	H_1	Nitromethane	P_1-K_2
Benzophenone	H_2	*Phenols*	
Benzyl ketone	H_2	Chlorohydroquinone	P_1-K_2
Cyclohexanone	P_1-H_1	Hydroquinone	P_1
Cyclopentanone	P_1	Phenol	P_1-K_2
Di-*n*-butyl ketone	H_1-H_2	Phloroglucinol	P_2-K_2
Ethyl methyl ketone	P_1		
Isopropyl methyl ketone	P_1		

D. Widespread Compounds Whose Belonging to a Group Is Dfficult to Foresee

Compound	Group	Compound	Group
Acetal	P_1-H_1	*tert*-Amyl alcohol	P_1
Acetamide	P_1-P_2	*n*-Amylamine	P_1
Acetophenone	H_1	Aniline	O
Acetoxime	P_1	Anthranilic acid	K_1(O)
Acetyl piperidine	P_1	Azelaic acid	K_1
Adipic acid	K_1	Barbituric acid	K_1
Allyl acetate	P_1-H_1	Benzene sulphinic acid	P_1-K_1
Allyl alcohol	P_1	Benzene sulphonic acid	P_2
β-Aminoethyl alcohol	P_2	Benzidine	O
α-Aminoisobutyric acid	P_2	Benzoyl acetone	H_2
m-Aminophenol	P_1-P_2-K_2	Benzoyl carbinol	P_1
o-Aminophenol	P_1-P_2-K_2	Benzyl alcohol	H_1
p-Aminophenol	K_2	Benzylamine	P_1
o-Amino-*p*-valeric acid	K_2(O)	Benzyl malonic acid	P_1-K_1
n-Amyl alcohol	H_1	Benzyl salicylate	K_2
sec-Amyl alcohol	P_1-H_1	Biuret	P_2-M

Table 46 (continued)

Compound	Group	Compound	Group
Bromal	P_1	Diethylamine	P_1
α-Bromopropionic acid	P_1-K_1	β-Diethyl aminoethyl ether	P_1
n-Butyl acetate	H_1	Diethyl barbituric acid	K_2
sec-Butyl acetate	H_1	Diethyl ether	P_1-H_1
n-Butyl alcohol	P_1	Diethyl ketone	P_1-H_1
n-Butyl carbonate	H_1-H_2	Dimethyl acetal	P_1-H_1
n-Butyl ether	H_2	2,4-Dinitroaniline	O-M
n-Butyl formate	P_1-H_1	Di-*n*-propylamine	P_1-O
n-Butyl oxalate	H_2	Diphenyl methane	H_2-I
n-Butyraldehyde	P_1-H_1	Dioxane	P_1
n-Butyramide	P_1	Durene (1,2,4,5-Tetramethyl benzene)	H_2
n-Butyric acid	P_1	Ethyl acetate	P_1-H_1
n-Butyronitrile	M	Ethyl acetoacetate	P_1
n-Butyryl chloride	P_1-H_1	Ethyl benzoate	H_2
Camphor	H_2	Ethyl carbonate	P_1-H_1
Carbon disulphide	M	Ethyl lactate	P_1-H_1
Chloral	P_1	Ethyl malonate	H_2
β-Chloroethyl acetate	H_1	Ethyl mercaptan	P_1-M
Chlorohydroquinone	P_1-K_2	Ethyl methyl ether	P_1
α-Chloropropionic acid	P_1	Ethyl methyl ketone	P_1
Citric acid	P_2	Ethyl nitrate	P_1-M
Cyanoacetic acid	P_1	Ethyl-*o*-formate	P_1-H_1
Cyclohexanol	H_1	Ethyl oxalate	P_1-H_1
Cyclohexanone	P_1-H_1	Ethyl phthalate	H_1
Cyclohexyl acetate	H_2	Ethyl salicylate	K_2
Cyclohexylamine	P_1	Ethyl succinate	H_1
Cyclopentanol	H_1	Ethylal	P_1-H_1
Cymene	I	Ethylene diamine	P_2
Diacetone alcohol	P_1	Ethylene glycol	P_2
Dibenzoyl methane	H_2	Formamide	P_1-P_2
α,β-Dibromopropionic acid	P_1-K_1	Formanilide	P_1-M
2,5-Dichlorohydroquinone	K_2	Fumaric acid	K_1
α,α-Dichloromethyl ether	P_1	Furfuryl alcohol	P_1
2,6-Dichloro-4-nitroaniline	M	Glutaric acid	P_2
		Glycerin	P_2
		Glycin	P_2
		Guanidine	P_2
		Hydroquinone	P_1

Polyoxymethylene	P_2-H_2
Propionamide	P_1-P_2

Table 46 (continued)

Compound	Group	Compound	Group
Propionitrile	P_1	2,4,6-Tribromophenol	K_1
Propionyl chloride	P_1	2,4,6-Trichloroaniline	O-M
n-Propyl acetate	P_1-H_1	2,4,6-Trichlorophenol	K_1
n-Propyl formate	P_1	Trimethylene glycol	P_2
Propylene glycol	P_1	Trimethylene cyanide	P_2-M
Protocatechuic aldehyde	P_1-K_2	Tri-*n*-propylamine	O
Pyridine	P_1	α-Triphenyl guanidine	O-M
Pyrocatechin	P_1	Urea	P_2
Pyrrole	M	Vanillin	K_1
Resorcinol	P_1	*n*-Valeric acid	K_1
Sebacic acid	K_1	*n*-Valeric aldehyde	H_1
Succinimide	P_1-P_2	Xylenes	H_2-I
Succinnitrile	P_1-P_2-M		
Sulphanilic acid	K_1		
Triacetin (glycerin triacetate)	P_1-H_1		
2,4,6-Tribromoaniline	M		

E. Separation of Mixtures

Table 46 (continued)

Mixture

1. The distilling off of volatile compounds ($t < 100$ °C)
   - Distillate
     - Compounds of all groups with five or less carbon atoms in a molecule, and also benzene and some other cyclic hydrocarbons whose boiling point is below 100 °C
   - Residue (remove water)
     - 2. Extraction with ether
       - Residue
         - 3. Removal of ether by heating and extraction with water
           - Residue
             - 4. Extraction with methanol
               - Residue*
               - Solution**
           - Solution
             - *Group* P_2
       - Ether solution
         - 5. The distilling off of ether and extraction with water
           - Residue
             - 6. Solution in ether and extraction with $1N$ HCl
               - Ether solution
                 - 7. Extraction with $2N$ NaOH
                   - Ether solution
                   - Water solution
               - Water solution
                 - Slight alkalization with $1N$ NaOH, extraction with ether, drying with K_2CO_3 and the distilling off of ether
                   - *Group* O
           - Solution
             - *Group* P_1

8. Water used to wash away NaOH, drying with sodium sulphate, decantation and the distilling off of ether

Groups M, H and I

Distilling off with vapour

- Residue → *Group* M
- Distillate*** → *Groups* H and I

9. Neutralized in the presence of the external indicator — bromothymol blue paper — and extracted with ether

- Ether solution → Dried with Na_2SO_4, ether is distilled off → *Group* K_2
- Water solution → 10. Acidified in the presence of methyl orange and extracted with ether
  - Ether solution → Ether is distilled off → Negatively-substituted phenols and acids of average strength of group K_1
  - Water solution → 11. Evaporated up to half the volume, cooled, acidified to pH = 1 (thymol blue), extracted with ether, extract is dried with Na_2SO_4, ether is distilled off → Strong acids of group K_1

---

* This residue may contain: many dinitro-derivatives of aromatic hydrocarbons and their amino-, oxy- and acid derivatives; many trinitro compounds of the aforementioned types; some dihalogen derivatives of anthracene, some amino-substituted sulphonic acids, a few amides and imides; benzyl- and benzoylureas, some derivatives of anthraquinone.

** This solution may contain: some dibromo- and dinitrobenzoic acids; a few other aromatic acids; some polyoxy- and polyaminoquinones and quinolines, a few aminophenols, amides and anilides; very few amines.

*** To separate group I, use can be made of the inertness of the compounds which belong to this group, oxidizing the compounds of group H, binding aldehydes and ketones by the saturated $NaHSO_4$ solution, and other methods. The presence of group I can be determined with the aid of concentrated H_2SO_4 using a part of the test.

Table 47

Substances Used for Drying

A. Drying of Gases

Substance	Characteristics	Amount of steam, mg, remaining in 1 litre of gas upon passing it at a rate of 1-5 l/h; $t=30.5$ °C
$CuSO_4$	Anhydrous	2.8
$CaCl_2$	Granulated; average composition: $CaCl_2 \cdot H_2O$	1.5
$CaCl_2$	Technically anhydrous; average composition: $CaCl_2 \cdot 1/4H_2O$	1.25
$ZnCl_2$	Stick	0.98
$Ba(ClO_4)_2$	Anhydrous	0.82
NaOH	Stick	0.80
$CaCl_2$	Anhydrous	0.36
$Mg(ClO_4)_2 \cdot 3H_2O$	—	0.031
KOH	Stick	0.014
Silica gel	—	0.006
$CaSO_4$	Anhydrous	0.005
CaO	—	0.003
H_2SO_4	100%	0.003
$Mg(ClO_4)_2$	Anhydrous	0.002
Al_2O_3	—	0.001
BaO	—	0.0007
P_2O_5	—	0.00003

B. Drying of Liquids

Liquid	Drier
Acids	Na_2SO_4
Alcohols	K_2CO_3, $CuSO_4$, CaO, Na_2SO_4 (but not $CaCl_2$, CaC_2)
Aldehydes	$CaCl_2$, $Mg(ClO_4)_2$
Amines	NaOH, KOH, K_2CO_3 (but not $CaCl_2$)
Bases	KOH, K_2CO_3, BaO
Carbon disulphide	$CaCl_2$, $Mg(ClO_4)_2$
Esters	Na_2SO_4, $CaCl_2$, $Mg(ClO_4)_2$
Ethers	$CaCl_2$, Na, CaC_2, K_2CO_3, $Mg(ClO_4)_2$
Hydrazines	K_2CO_3
Hydrocarbons	$CaCl_2$, Na, CaC_2, $Mg(ClO_4)_2$
halogen-derivative ones	$CaCl_2$, $Mg(ClO_4)_2$ (but not Na)
Ketones	K_2CO_3, $CaCl_2$, $Mg(ClO_4)_2$ (for higher ketones)
Nitriles	K_2CO_3
Nitro compounds	$CaCl_2$, Na_2SO_4, $Mg(ClO_4)_2$
Phenols	Na_2SO_4

Table 48

Preparation of Hygrostats

Relative pressure of water vapour over mixtures of solid salts with their saturated aqueous solutions, over mixtures of anhydrous salts with their hydrates and over mixtures of two differing hydrates; water vapour pressure at a given temperature is taken as unity.

Mixture	Temperature, °C				
	10	15	20	25	30
	relative water vapour pressure				
P_2O_5	—	—	< 0.01	—	—
KOH	—	—	0.05	—	—
$NaOH$	—	—	0.06	—	—
$CaBr_2 \cdot 6H_2O$	0.23	0.21	0.19	0.17	0.15
$CaCl_2 \cdot 6H_2O$	0.38	0.35	0.32	0.29	0.26
$K_2CO_3 \cdot 2H_2O$	—	—	0.44	0.45	—
$Ca(NO_3)_2 \cdot 4H_2O$	0.65	0.60	0.55	0.50	0.45
$NaBr \cdot 2H_2O$	0.63	0.61	0.59	0.57	0.55

$CaCl_2 \cdot H_2O + CaCl_2 \cdot 2H_2O$	—	0.05	—	—	—
$CaCl_2 \cdot 2H_2O + CaCl_2 \cdot 6H_2O$	0.21	0.21	0.22	0.22	0.23
$Na_2B_4O_7 \cdot 5H_2O + Na_2B_4O_7 \times$ $\times 10H_2O$	—	—	0.39	—	—
$Na_2HPO_4 \cdot 2H_2O + Na_2HPO_4 \times$ $\times 7H_2O$	0.50	0.53	0.56	0.59	0.62
$Na_2CO_3 \cdot H_2O + Na_2CO_3 \cdot 10H_2O$	0.66	0.69	0.72	0.76	—
$Na_2HPO_4 \cdot 7H_2O + Na_2HPO_4 \times$ $\times 12H_2O$	0.65	0.70	0.75	0.81	—

Table 49

Principal Organic Reagents

Abbreviations used: grav. for gravimetric analysis; vol. for volumetric and similar analyses. In cases of gravimetric and volumetric one atom of a metal is given in parentheses in the sixth column.

A. In the Alphabetical Order of the Reagents

No.	Reagent	Synonymous names
1	Alberon 	Dichlorosulphodimethyloxyfuchsone dicarboxylic acid; chromoxane pure blue dye BLD
2	Alizarin 	1,2-Dioxyanthraquinone
3	Alizarin Red S 	Alizarin S; sodium alizarin sulphonate; 1,2-dihydroxyanthraquinone-3-sulphoni c acid, sodium salt

metric analysis; phot. for colorimetric, spectrophotometric, fluoro-determinations, the number of molecules of a reagent bounded with

Molecular weight		Elements being determined	Method
M	$\log M$		
539.35	73 188	Be^{2+}, Al^{3+}	Phot.
240.22	38 061	Al^{3+}, Zr^{IV}, Th^{IV}, F^-	Phot.
360.28	55 664	Al^{3+}, Zr^{IV}, Th^{IV}, Ga^{3+}, F^-, Ti^{IV}, UO_2^{2+}	Phot.

No.	Reagent	Synonymous names
4	Aluminon 	Ammonium salt of aurine tricarboxylic acid
5	Anthranilic acid 	*o*-Aminobenzoic acid
6	Arsasene 	1″, 4-Diazoamino-1,1′-azobenzene-4″-nitrobenzene arsonic acid-2″
7	Arsenazo I 	Benzene-2′-arsonic acid-(1′-azo-2)-1,8-dihydroxynaphthalene-3,6-disulphonic acid, disodium salt; uranon
8	Arsenazo III 	Benzene-2′-arsonic acid-(1′-azo-2)-benzene-2″-arsonic acid-(1″-azo-7)-1,8-dihydroxynaphthalene-3,6-disulphonic acid

* RE: rare-earth elements (lanthanoids, Y and Sc).

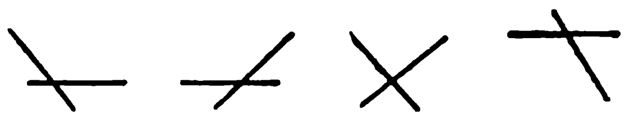
II	Ti^{IV}, V^{V}	V^{II}	—

Table 53

Conditions of Amperometric Titration with Two Polarized

Forms of titration curves



I *II* *III* *IV*

In amperometric titration with two polarized electrodes, the latter must be in the titrate simultaneously and must have a sufficiently large surface (this being the difference in respect of classical amperometric titration with a microelectrode). Voltage is applied to the electrodes with the aid of a voltage divider from an external source of direct current with a small output voltage (~2-4 V). The amount of voltage applied to the electrodes is controlled (without trying to achieve great accuracy) by a d.c. voltmeter which is connected to the circuit parallel to the electrodes.

The fourth column of the table gives approximate voltages applied to the electrodes, at which the latter are depolarized before the equivalence point or after it, or in the entire process of titration.

The fifth column gives the oxidation-reduction systems whose components provide an indicator current, which arises due to the

Substance being determined	Titrant	Electrode material	Voltage being applied, mV	Electrode reactions indicator	
				before the equivalence point	
Ag^{I}	Cl^-, Br^-, I^-	Hg	from 1 to 10	$Ag^{I}/Hg\downarrow$	
Al^{III}	F^-	Pt	100	—	
As^{III}	BrO_3^-	Pt	50	—	
	$Fe(CN)_6^{3-}$	Pt	200	—	

Indicator Electrodes (according to O. A. Songina)

depolarization of electrodes. The dashes in this column indicate the absence of the indicator current either before or after the equivalence point at a given voltage applied to the indicator electrodes. This occurs when, in the process of titration, the components of an oxidation-reduction system either being formed or present in the titrate cannot, at a given voltage, be oxidized and reduced at the electrodes, or when one of the conjugated forms of the redox pair is absent.

In some cases, depending on the composition and amount of voltage applied to the electrodes, an oxidized form of one and a reduced form of another redox system can participate in electrochemical reactions, thus providing an indicator current before and (or) after the equivalence point.

In the sixth column, Roman numerals indicate the forms of titration curves near the equivalence point.

which induce the current	Form of titration curves near the equivalence point	Remarks
after the equivalence point		
—	I	As electrodes, ground mercury is used. Before the equivalence point is reached, the electrode material—Hg↓ (anode)—is oxidized, and Ag^{I} is reduced at the cathode
—	IV	Titration is conducted in the presence of the redox pair Fe^{III}/Fe^{II}
Br_2/Br^-	II	Titration is conducted in the presence of Br^-
$Fe(CN)_6^{3-}/Fe(CN)_6^{4-}$	II	Titration is conducted in the presence of an OsO_4 catalyst

which induce the current — after the equivalence point	Form of titration curves near the equivalence point	Remarks
H^+/Pb^{II}	II	Beyond the equivalence point, H^+ is reduced at the cathode, and Pb^{II} is oxidized at the anode
H^+/cupferron	II	Beyond the equivalence point, H^+ is reduced at the cathode, and cupferron is oxidized at the anode
$Fe(CN)_6^{3-}/Fe(CN)_6^{4-}$	II	Titration is conducted in the presence of $Fe(CN)_6^{3-}$

Table 54

Overvoltage of Hydrogen and Oxygen at Various Electrodes

(at room temperature)

The dependence of the hydrogen overvoltage η_{H_2} on current density is expressed by the equation

$$\eta_{H_2} = 0.116 \log i + k$$

where k is a constant which depends on the nature of the electrode. With a rise in temperature, the value of overvoltage decreases by 3 mV/°C. In an alkaline medium, hydrogen overvoltage is as a rule somewhat greater (by 0.1-0.3 V) than in an acidic medium. The overvoltage of oxygen in an alkaline medium is approximately one volt greater than in an acidic medium. The overvoltage of electroseparation of metals is considerably less than that of gases.

Electrode	Composition of the solution	Current density, A/cm², overvoltage, V: 0.00005 and less	0.0001	0.001	0.01	0.1

Appendices

Examples of Using Some Tables

Table 7

Analytical and Stoichiometric Multipliers (Factors)

The table is intended above all for calculations connected with analytical determinations by gravimetric methods.

When the content of a component is being determined in some material, two cases are possible.

1. *The unknown component is weighed in the form in which it is desirable to express its content in the substance being analysed*; for example, in determining the Cu content in bronze, copper is separated by electrolysis and weighed as such, and in another case, SiO_2 from the mineral is weighed in the form of SiO_2, whose form usually expresses the Si content of minerals in rocks. In these cases, the percentage of the unknown component is calculated by the simple formula

$$x = \frac{a \times 100}{g} \%$$

where a = mass of the separated component;

g = weighed portion of a substance taken for analysis (a and g are expressed in the same mass units).

For calculation, two logarithms must be found without using Table 7.

2. *The unknown component is weighed in a form that is different from the one in which it is desirable to express the result of the analysis*; for example, the determination of P is completed by weighing a calcined precipitate of $Mg_2P_2O_7$ or, in determining Si in steel, the analysis is completed likewise by weighing SiO_2, as in the case of analysing the mineral, but the result must be expressed in the percentage of the element (Si). Sometimes, the weighed substance does not contain the element being determined. Thus, in determining N in ammonium salt, ammonium is occasionally precipitated in the form of $(NH_4)_2PtCl_6$ which is then calcined; Pt obtained is weighed. The content of Pt is used to calculate the percentage of N in the salt being analysed.

In all these cases it is obviously necessary to calculate the amount of the unknown component to which the found mass of the weighed substance (a) corresponds. Therefore, in determining Si, mass a must be divided by the molecular weight of SiO_2 and multiplied by the atomic weight of Si, i.e., $\frac{a\,Si}{SiO_2}$; in determining P, the found mass a must be divided by the molecular weight of $Mg_2P_2O_7$ and multiplied by the double atomic weight of P (since the $Mg_2P_2O_7$ molecule con-

tains 2P), i.e., $\frac{a\,2P}{Mg_2P_2O_7}$; in *determining N, the found mass a must* be divided by the atomic weight of Pt and multiplied by the double atomic weight of N, i.e., $\frac{a\,2N}{Pt}$, since in the $(NH_4)_2PtCl_6$ compound, two atoms of N combine with one atom of Pt. All the values of these fractions, i.e., $\frac{Si}{SiO_2}$, $\frac{2P}{Mg_2P_2O_7}$, $\frac{2N}{Pt}$, etc., and their logarithms, are given in Table 7, where they are called multipliers and designated by the letter f (they are also called *factors*, *conversion factors*, *chemical multipliers*). Thus, the content of the component being determined in the weighed substance will be af, and its percentage in the material being analysed will be:

$$x = \frac{af \times 100}{g}\,\%$$

Thus, the calculation is performed by finding three logarithms (one from Table 7, and two from the common logarithm table), adding two of them and subtracting the third one.

Since the operation of addition and subtraction cannot be performed in one column, it is necessary to learn how to quickly find its complement to unity by logarithm. Then, the entire operation consists in adding three mantissas: $\log x = \log a + \log f + (1 - \log g)$. The characteristics and the whole number 2 ($\log 100 = 2$) are not taken into account. When the operation is completed and the number x is found by its logarithm, it is easy to find the proper place of the decimal point in it, since it is always known whether the material being analysed contains, say, 8.3 or 83 or 0.83 per cent of the component being determined.

To find the complement of $\log g$ to unity, the last figure of the mantissa is subtracted from 10, and the remaining figures are subtracted from 9; for example, if the mantissa of $\log g$ is 34 906, its complement to unity is 65 094.

Examples of Calculating the Results of Gravimetric, Analytical Determinations

Example 1. To determine Cu in brass, a portion of a shaving g weighing 1.1238 g is taken. The mass of a pure platinum electrode is 12.4826 g; the mass of the same electrode coated with deposited Cu is 13.2965 g after drying. Find the percentage of Cu in the alloy.

The mass of deposited Cu a = 13.2965 g — 12.4826 g = 0.8139 g. The unknown percentage of Cu is $x = \frac{0.8139 \times 100}{1.1238}\,\%$. We find the logarithms in Table 58 (p. 448) and write down the mantissas without the characteristics:

$$\begin{array}{r} 91\,057 \\ -\,05\,069 \\ \hline \end{array}$$

$$\log x = 85\,988;\quad x = 72.42\%$$

It is easy to see from the calculating formula that the final result will have two digits before the decimal point. In working out this

example, we did not have to use the multipliers of Table 7, since the component of brass (Cu) being determined was weighed in the form of metal.

Example 2. To determine Mg in limestone, a portion weighing 1.2456 g is taken. After SiO_2, Fe, Al and Ca are separated, Mg is precipitated in the form of $MgNH_4PO_4$ which by calcination is converted to $Mg_2P_2O_7$; the mass of the calcined precipitate $a = 0.0551$ g. Find the percentage of magnesium in the limestone.

We find in the common logarithm table: $\log g = \log 1.2456 =$ $= 09\,540$; $\log a = \log 0.0551 = 74\,115$. As in the preceding example, we find only the mantissas.

In Table 7 we find Mg in the first column, $Mg_2P_2O_7$ in the next column, and then on the same line the value of multiplier f equal to 0.2184, and $\log f$ equal to 33 930. Now we add:

$$\begin{array}{r} \log a = 74\,115 \\ \log f = 33\,930 \\ 1 - \log g = 90\,460 \\ \hline \log x = 98\,505 \end{array}$$

The Mg content is 0.966 or 0.97%.

Since in the mass of the calcined precipitate weighing 0.0551 g, the maximum absolute error is ± 0.0002 g (an inaccuracy of ordinary weighings on an analytical balance), which is 0.4% of the relative error, the same maximum relative error will be also in the final result (rule 4, p. 11), i.e., the answer will be $0.966 \pm 0.004\%$. We see that the answer must not have more than three figures after the decimal point, since the third figure is already dubious. However, considering that during the analysis there may be other sources of errors besides the inaccuracy in weighing, it is expedient to round the result obtained to 0.97%.

Table 14

Calculation of the Results of Volumetric-Analytical Determinations

In finding the results of volumetric-analytical determinations, unnecessary and intricate calculations are often performed. For example, in calculating the amount of Fe titrated with the $KMnO_4$ solution, the amount of $KMnO_4$ that has reacted is calculated at first, and then the stoichiometric ratio (1 mole of $KMnO_4$: 5 moles of Fe^{2+}) is used to determine the Fe content. This is an intricate way of calculation, and therefore it is unacceptable. To simplify similar calculations the concentrations of solutions are expressed in normalities.

The *normality* or the normal concentration of a solution is the number of gram-equivalents of a solute in one litre of the solution or the number of milligram equivalents in one millilitre of the solution.

Chemical equivalent is a term applied to the active part of an atom or a molecule which:

(a) *in neutralization reactions* corresponds to one hydrogen ion H^+ or one hydroxyl ion OH^- that forms water.

For example, in the reaction $H_3PO_4 + 2NaOH = Na_2HPO_4 + 2H_2O$, two ions of H^+ and two ions of OH^- form two molecules of H_2O. It follows that there are 1/2 molecule of H_3PO_4 and one molecule $\left(\frac{2NaOH}{2}\right)$ of caustic soda per one ion of H^+ or OH^-. These values are their equivalents;

(b) *in oxidation-reduction reactions* corresponds to one electron that a molecule or an ion of a substance accepts or gives off in a given reaction.

For example, $KMnO_4$ reacts as an oxidizing agent in an acid medium according to the equation:

$$MnO_4^- + 8H^+ + 5e \rightarrow Mn^{2+} + 4H_2O$$

It follows that there is $1/5MnO_4^-$ or $1/5KMnO_4$ per electron, which are equivalents. Oxalic acid $H_2C_2O_4$ reacts as a reducing agent according to the equation

$$C_2O_4^{2-} - 2e \rightarrow 2CO_2$$

it follows that there is $1/2C_2O_4^{2-}$, or $1/2H_2C_2O_4$, or $1/2H_2C_2O_4 \cdot 2H_2O$ per one electron; these values are the equivalents;

(c) *in precipitation and complexing reactions* corresponds to one ion of a univalent metal, 1/2 ion of a bivalent metal, and so forth, that form a precipitate or a complex compound. Thus, in titrating cyanide with silver salt according to Mohr:

$$Ag^+ + CN^- = AgCN \quad \text{or} \quad AgNO_3 + KCN = AgCN + KNO_3$$

the equivalent of KCN is equal to one molecule, and in titrating the same cyanide according to Denigès:

$$Ag^+ + 2CN^- = Ag(CN)_2^- \quad \text{or} \quad AgNO_3 + 2KCN = KAg(CN)_2 + KNO_3$$

the equivalent of KCN is equal to two molecules.

From the above examples, we see that the *chemical equivalent of a substance is not a constant number*, but depends on the reaction in which the substance participates.

Gram-equivalent (*or milligram-equivalent*) weight of an element or compound is its equivalent weight expressed in grams (or milligrams).

If the concentration (titre) of a titrating solution (sometimes called a standard solution) is expressed by its normality N_s, and E_s is its equivalent weight, every millilitre of the solution will contain N_sE_s mg of the titrating substance. Having used V ml of the solution in the titration, we introduced VN_sE_s mg of the titrating substance into the reaction. Since a reaction occurs always between the quantities of the substances proportional to their equivalents, the quantity of the titrated substance (being determined) will be VN_sE_x mg, where E_x is the equivalent weight of the substance being determined. It follows that for calculations, it is necessary to know only the normality of the titrating solution N_s and the equivalent weight E_x of the substance being determined. The latter can be found in Table 14.

The percentage (x) of the substance being determined in the weighed portion (g) is calculated by the formula:

$$x = \frac{VN_sE_x \times 100}{g} \% \quad \text{or} \quad \frac{VN_sE_x}{g' \cdot 10} \%$$

where g is expressed in mg, and g' in grams.

A. Determination of the Normality of a Titrant (Finding of the Titre)

In establishing the normality of a solution, a certain amount of a starting substance g_s is weighed. The weighed portion is dissolved and the solution obtained is titrated with the solution whose normality (N_x) is to be determined. Suppose V ml is used in titration. Then $VN_xE_s = g_s$ and

$$N_x = \frac{g_s}{VE_s}$$

where E_s is the equivalent weight of the starting substance which can be found in Table 14; the value of g_s is expressed in mg.

The weighed portion of the substance is dissolved in a suitable solvent (usually water) in a volumetric flask, diluted with it to volume (V_1 ml), and a certain volume (V_2 ml) is taken for the titration with a pipette. In this case

$$N_x = \frac{g_sV_2}{V_1VE_s}$$

Example 1. A portion of pure sodium oxalate $Na_2C_2O_4$ dried at 105-110 °C weighing 0.2712 g is dissolved in water. On adding H_2SO_4, the solution is titrated with 39.88 ml of the $KMnO_4$ solution. Calculate the normality of the latter.

In Table 14, we find:

$$\begin{aligned}
E_{Na_2C_2O_4} = 67\ 000;\ \log E_s &= 82\ 607 \\
\log g_s = \log 271.2 &= 43\ 329 \\
1 - \log V = 1 - \log 39.88 &= 39\ 924 \\
1 - \log E_s = 1 - \log 67\ 000 &= 17\ 393 \\
\hline
\log N_x &= 00\ 646;\ N_x = 0.1015
\end{aligned}$$

If the normality of a solution (N_1) is determined according to another solution of known normality (N_2), then V_1 ml of the former is titrated with the latter. Suppose V_2 ml of the latter solution is used in the titration. Then

$$V_1N_1 = V_2N_2$$

$$N_1 = N_2\frac{V_2}{V_1}$$

Example 2. The normality of the NaOH solution (N_1) is established according to 0.09854N HCl solution. For the titration of 20.00 ml of the former, 21.12 ml of the latter are used. Calculate the normality

of the NaOH solution

$$N_1 = \frac{0.09854 \times 21.12}{20.00}$$

$$\begin{aligned} \log 0.09854 &= 99\ 362 \\ \log 21.12 &= 32\ 469 \\ 1 - \log 20.00 &= 69\ 897 \\ \hline \log N_1 = 01\ 728;\ N_1 &= 0.1041 \end{aligned}$$

In practice, the concentration of the titrant ($T_{s/x}$, titre of the solution according to the substance being determined) is very often expressed in the amount (in mg or g) of the substance being determined that titrates 1 ml of the T_x solution. Knowing the normality of the solution, it is easy to find its titre by the following formula relative to any substance being determined: $T_{s/x} = N_s E_x$ (E_x can be found in Table 14). For example, the titre of 0.1023N $KMnO_4$ solution relative to iron is $T_{MnO_4^-/Fe} = N_s E_{Fe} = 0.1023 \times$ $\times$ 55.847 mg/ml; its titre relative to iron oxide is $T_{MnO_4^-/Fe_2O_3} =$ $= N_s E_{Fe_2O_3} = 0.1023 \times 79.846$, etc. The percentage of the substance being determined is

$$x = \frac{V N_s E_x \times 100}{g} = \frac{V T_{s/x} \times 100}{g}\ \%$$

where g and $T_{s/x}$ are expressed in the same units.

If a titre of a solution relative to a substance is known and if it is necessary to find its normality or titre relative to another substance, the following formulas can be used:

$$N = \frac{T_a}{E_a} = \frac{T_b}{E_b} = \ldots = \frac{T_n}{E_n}$$

hence

$$T_b = T\frac{T_a}{E_a}E_b = NE_b = \ldots;\ T_n = \frac{T_a}{E_a}E_n = NE_n$$

Example 3. The titre of the $KMnO_4$ solution relative to Fe is 0.005483 g/ml. Find the normality of this solution and its titre relative to Cr.

$$N = \frac{T_{MnO_4^-/Fe}}{E_{Fe}};\quad \log T_{MnO_4^-/Fe} = \log 0.005483 = 73\ 902$$

$$\begin{aligned} 1 - \log E_{Fe} = 1 - \log 55.847 &= 25\ 300 \\ \hline \log N &= 99\ 202 \\ N &= 0.09818 \end{aligned}$$

$$T_{MnO_4^-/Cr} = \frac{T_{MnO_4^-/Fe}E_{Cr}}{E_{Fe}};$$

$$\log T_{MnO_4^-/Fe} = 1 - \log 55.847 = 73\,902$$
$$1 - \log E_{Fe} = 1 - \log 55.85 = 25\,300$$
$$\log E_{Cr} = \log 17.332 = 23\,885$$
$$\overline{\log T_{MnO_4^-/Cr} = 23\,087}$$
$$T_{MnO_4^-/Cr} = 0.001702 \text{ g}$$

B. Determination of the Percentage of the Unknown Component in a Test

Example 1. To determine the Na_2CO_3 content in a soda melt, a portion of it weighing 1.100 g is dissolved in water and the solution obtained is titrated with 0.5012*N* H_2SO_4 solution in the presence of a bromophenol blue indicator. What is the percentage of Na_2CO_3 if 35.00 ml of the acid are used in the titration?

Using Table 14 (see A, *Acid-Base Titration*), we find that $E_{Na_2CO_3}$, with a bromophenol blue indicator, is 52.995, $\log E$ = 72 423.

$$\log V = \log 35.00 = 54\,407$$
$$\log N_s = \log 0.5012 = 70\,001$$
$$\log E_x = \log 52.995 = 72\,423$$
$$1 - \log g = 1 - \log 1.100 = 95\,861$$
$$\overline{\log x = 92\,692; \quad x = 84.51\%}$$

Example 2. Using the same data as in Example 1, find the percentage of CO_2 in the soda melt.

The solution remains the same, but instead of $E_{Na_2CO_3}$, we find $E_{CO_2} = 22.005$; $\log E = 34\,252$ in Table 14.

Summing up:

$$\log V = 54\,407$$
$$\log N_s = 69\,897$$
$$\log E_x = 34\,252$$
$$1 - \log g = 95\,861$$
$$\overline{\log x = 54\,417; \quad x = 35.01\%}$$

Example 3. Calculate the percentage of Fe in a sample of iron ore if on dissolving a portion of the ore weighing 0.7872 g and reducing Fe by metallic Zn, 47.24 ml of 0.1105*N* $KMnO_4$ solution were used in titration.

From Table 14 (see B, *Oxidation-Reduction Methods*) we have: $E_{Fe} = 55.85$; $\log E = 74\,702$. Addition gives

$$\log V = \log 47.24 = 67\,431$$
$$\log N_s = \log 0.1105 = 04\,336$$
$$\log E_x = \log 55.847 = 74\,700$$
$$1 - \log g = 1 - \log 0.7872 = 10\,391$$
$$\overline{\log x = 56\,858; \quad x = 37.03\%}$$

Example 4. To determine Mn in steel by the bismuthate method, a portion weighing 1.1452 g is dissolved in HNO_3. In the solution obtained, Mn is oxidized with sodium bismuthate $NaBiO_3$ to $HMnO_4$. The latter is determined by the addition of 40.00 ml of $0.02842N$ solution of Mohr's salt and a back titration with 13.50 ml of $0.03012N$ $KMnO_4$ solution. Find the percentage of Mn in the solution.

Since the product VN gives the number of mg-equiv of *any* substance, it is expedient to perform the calculation by the following formula:

$$x = \frac{(V_a N_a - V_b N_b) E_x \cdot 100}{g} \%$$

where V_a and N_a = volume and normality of the solution of Mohr's salt, respectively
and V_b and N_b = volume and normality of the $KMnO_4$ solution.

In Table 14 we find that in determining manganese by the bismuthate method, $E_x = E_{Mn} = 10.9876$; $\log E_x = 04090$.

We have:

$$\begin{aligned} V_a N_a &= 40.00 \times 0.02842 = 1.1368 \text{ mg-equiv} \\ V_b N_b &= 13.50 \times 0.03012 = 0.4066 \text{ mg-equiv} \\ V_a N_a - V_b N_b &= 1.1368 - 0.4066 = 0.7302 \text{ mg-equiv} \\ \log 0.7302 &= \bar{1}86\ 344 \\ \log E_{Mn} &= 04\ 090 \\ 1 - \log 1.1452 &= \bar{1}94\ 110 \\ \hline \log x &= \bar{1}84\ 544;\ x = 0.70\% \end{aligned}$$

Example 5. How much of the $KMnO_4$ solution of the same concentration would be used in the titration of a portion weighing 1.1452 g of the same steel (see Example 4) if Mn was determined not by the bismuthate method, but by Volhard's method?

$$x = \frac{VN_s E_x \cdot 100}{g} \%$$

Here g is the weighed portion expressed in milligrams.

In Table 14, we find that, when Mn is determined by Volhard's method, E_{Mn} is 16.4814, $\log E = 21\ 699$.

$$0.70 = \frac{V \times 0.03012 \times 16.4814 \times 100}{1145.2}; \quad V = \frac{0.70 \times 1145.2}{0.03012 \times 16.4814 \times 100}$$

$$\begin{aligned} \log 0.70 &= \bar{1}84\ 510 \\ \log 1145.2 &= 05\ 889 \\ 1 - \log 0.03012 &= 52\ 115 \\ 1 - \log 16.4814 &= \bar{2}78\ 301 \\ \hline \log V &= 20\ 815;\ V = 16.15 \text{ ml} \end{aligned}$$

Table 16

Calculation of the Results of Gas and Gasometric Analyses

Here are examples of calculations made according to the formulas given on p. 136.

Example 1. The volume of gas (V), measured over water, is 25.6 ml. The temperature of gas $t = 22.8$ °C. Barometer reading $P_t = 720.4$ mm Hg. The temperature of air, measured near the barometer, $t' = 22.4$ °C. Bring the volume of gas to standard conditions.

First of all, the barometer reading is corrected.

To bring it to 0 °C, we should subtract $t'/8$ mm from it. Then, since the gas is collected over water, its pressure in the vessel is less than the pressure of the surrounding air by the value of P_B which is the water vapour pressure at $t = 22.8$ °C. This value must also be subtracted from the barometer reading.

In Table 16, in the "Water" column with $t = 22$ °C we have $P_B = 19.8$ mm Hg, and with $t = 23$ °C, $P_B = 21.1$ mm Hg. The difference between them is 1.3 mm Hg. We find 0.8 of this difference: $0.8 \times 1.3 = 1.0$ mm and add it to 19.8 mm Hg. It follows that P_B at 22.8 °C is $19.8 + 1.0 = 20.8$ mm Hg.

Hence,

$$P_0 = 720.4 - \frac{22.4}{8} - 20.8 = 696.8 \text{ mm Hg}$$

The unknown volume of gas $V_0 = VF$. To find $\log F$, we use section A.

We have:

t, °C	$P_0 = 696$ mm Hg	$P_0 = 696.8$ mm Hg	$P_0 = 697$ mm Hg
22	92 807	92 857	92 870
22.8	—	92 739	—
23	92 660		

H

The difference between 92 807 and 92 870 is 63. In the table of differences, we find 0.8 of this number and add it to 92 807, we obtain 92 857. The difference between 92 807 and 92 660 is 147. In the table of differences, we find 148, which is the nearest number to it and of which 0.8 is 118.5, subtracting this number from 92 857 we get approximately 92 739.

$$\begin{array}{l} \log V = 40\,824 \\ \log F = 92\,739 \\ \hline \log V_0 = 33\,563; \; V_0 = 21.66 \approx 21.7 \text{ ml} \end{array}$$

It should be noted that in most analytical cases there is no need to make a correction for decimal fractions of a millimetre of pressure and decimal fractions of a degree of temperature: rounding the respective figures, we obtain results of sufficient accuracy. Thus, if we take $P_B = 21.1$ mm Hg, the value corresponding to 23 °C, we would obtain $P_0 = 696.5 \approx 697$ mm Hg. From Table 16,A, for $t = 23$ °C and

P_0 = 697 mm Hg we would have log F = 92 723, and finally V_0 = = 21.65 ml, which differs little from the preceding result.

Example 2. What is the weight of 43.7 ml of NO, measured over 28.6% KOH solution at 17 °C and a barometer reading of 757 mm Hg? Suppose the temperature of mercury in the barometer is also 17 °C:

$$P_0 = 757 - \frac{17}{8} - 10.2 \approx 745 \text{ mm Hg}$$

The value of 10.2 mm Hg is found in Table 16,B (17 °C, KOH 28.6%).

The unknown mass is equal to $VF\rho$; we find log F in Table 16,A, and log ρ in Table 16,C:

$$\begin{aligned} \log V = \log 43.7 &= 64\ 048 \\ \log F &= 96\ 506 \\ \log \rho = \log 1.3402 &= 12\ 717 \\ \hline \log x &= 73\ 271;\ x = 54.0 \text{ mg} \end{aligned}$$

Example 3. From 1.200 g of commercial calcium carbide, 395 ml of acetylene (C_2H_2) is obtained at 17.5 °C and P_t = 755.3 mm Hg (the pressure is measured at 16 °C). The gas is collected over a saturated NaCl solution. Calculate the percentage of CaC_2 in commercial carbide.

$$P_0 = 755.3 - \frac{16}{8} - 11.4 = 741.9 \text{ mm Hg}$$

The value of 11.4 is found in Table 16,B, interpolating between the numbers 11.0 and 11.7.

The unknown percentage is

$$x = \frac{VFf' \times 100}{g}\ \%$$

The value of F is found in Table 16,A, and f' in Table 16,D.

$$\begin{aligned} \log V = \log 395 &= 59\ 660 \\ \log F &= 96\ 256 \\ \log f' = \log 2.8877 &= 46\ 055 \\ 1 - \log g = 1 - \log 1200 &= 92\ 082 \\ \hline \log x &= 94\ 053;\ x = 87.20\% \end{aligned}$$

Example 4. In the reaction of an acid with 0.250 g of zinc dust, 79.6 ml of H_2 is evolved, the latter being measured over water at 20 °C and a pressure of 742 mm Hg (the temperature of mercury in the barometer is also 20 °C). Calculate the Zn content in the zinc dust.

$$P_0 = 742 - \frac{20}{8} - 17.5 = 722 \text{ mm Hg}$$

$$x = \frac{VFf' \cdot 100}{g}\ \%$$

$$\begin{aligned}\log V = \log 79.6 &= 90\ 091\\ \log F &= 94\ 696\\ \log f' = \log 2.9145 &= 46\ 456\\ 1 - \log g = 1 - \log 250 &= 60\ 206\\ \hline \log x &= 91\ 449;\ x = 82.13 \cong 82.1\%\end{aligned}$$

The final result must not have more than three significant figures, since only three significant figures contain the results of weighing and volumetric measurement.

In some instruments, gas burettes are calibrated in a way that they directly read the percentage of the substance being determined if the weighed portion is constant (usually 1 g or 0.5 g) and if the gas in the burette is at a definite temperature and pressure. But when the temperature and gas pressure do not coincide with those indicated on the burette, a corresponding recalculation must be made.

Example 5. In determining C in steel by the combustion method in the O_2 current, the volume of CO_2 formed is measured with a gas burette of the Wirtz-Strölein instrument showing the percentage of C when the weighed portion of steel is 1000 g and when the temperature and gas pressure in the burette are 16 °C and 760 mm Hg. A portion of steel weighing 1000 g is taken; the temperature and gas pressure are 20 °C and 740 mm Hg. The burette reading is 0.52% C.

What is the real content of C in steel? In Table 16A, we find $\log F_{760,16\,°C} = 97\ 522$; $\log F_{740,20\,°C} = 95\ 766$. The first logarithm must be subtracted from the logarithm of the percentage of C found, and the second logarithm must be added to it:

$$\begin{aligned}\log 0.52 &= 71\ 600\\ 1 - 97\ 522 &= 02\ 478\\ &\ 95\ 766\\ \hline \log x &= 69\ 844;\ x = 0.49\%\end{aligned}$$

The difference in the values of vapour pressure over the concentrated alkaline solution at different temperatures is neglected here. If the temperature of the measured gas deviates from 16 °C only by several degrees, the error arising from this is not over 0.01%.

Table 18

Densities and Concentrations of Solutions

In literature dealing with analytical chemistry, concentrations of acids and bases are expressed in different ways: (1) in terms of density (for example: "5 ml of hydrochloric acid with a density of 1.19 is added"); (2) in terms of the dilution of concentrated commercial acids [for example: "10 ml of diluted (1 : 9) sulphuric acid is added to the solution", which means that one volume of concentrated commercial sulphuric acid is diluted with nine volumes of water]; (3) in terms of the percentage of the reagent (for example: "2 ml of 25% ammonia solution") and, finally, (4) in terms of the normality of the solution.

An analyst has therefore to convert the concentrations in calculating reagents used in the reaction on the basis of the solutions whose concentrations are expressed in different ways, and so forth. The conversion tables serve the purpose. It is the easiest to perform stoichiometric calculations if the concentrations of reagents are expressed in their normalities. Therefore, the tables give the normal concentrations of acid and base solutions.

Here are a few examples concerning calculations with these tables.

Example 1. In analysing tin bronze, nitric acid with a density of 1.2 g/cm^3 is used to dissolve it. How can the acid be prepared from concentrated commercial nitric acid with a density of 1.4 g/cm^3 without the aid of an areometer? The normality of nitric acid with a density of 1.200 is 6.273*N* (Table 18,A); it follows that one litre of it must contain 6.273 g-equiv. The normality of concentrated nitric acid with a density of 1.400 is 14.88*N*; one litre of it contains 14.88 g-equiv. The required quantity (6.273) of gram-equivalents of HNO_3 is contained in $\frac{6.273}{14.88} \times 1000 = 421.6$ ml of concentrated nitric acid. Measuring out this volume and diluting it with water to one litre, we obtain nitric acid whose density is 1.2.

Example 2. In the course of an analysis, 5 ml of diluted (1 : 4) HNO_3 are added to a neutral solution and then neutralized with ammonia. How many millilitres of concentrated (25%) ammonia solution will be used in the neutralization reaction?

The expression "diluted (1 : 4) nitric acid" implies that one volume of concentrated nitric acid with a density of 1.400 is diluted with four volumes of water. The normality of concentrated acid with a density of 1.400 is 14.88*N*, and that of the diluted acid will apparently be 14.88 : 5 = 2.98*N*. Five millilitres of this acid are added to the solution being analysed; to neutralize it, 5 ml of ammonia solution of the same normality (2.98*N*) are apparently necessary. The normality of concentrated 25% ammonia solution is 13.32*N* (Table 18,I). It follows that, to neutralize nitric acid, $\frac{5 \times 2.98}{13.32} =$ $= 1.12$ ml of concentrated ammonia solution will be used.

Example 3. A portion of rock weighing 1 g is melted in a platinum crucible with six times as much anhydrous Na_2CO_3. The melt is leached with water and oxidized with diluted (1 : 1) hydrochloric acid. How many millilitres of this acid must be added to completely neutralize Na_2CO_3 without the acid being too excessive?

$$6\text{g of } Na_2CO_3 \text{ contain } \frac{6}{1/2Na_2CO_3} = \frac{6}{52.9945} \text{ g-equiv}$$

or

$$\frac{6000}{52.9945} = 113.23 \text{ mg-equiv}$$

For neutralization, it is necessary to add the same quantity of milligram-equivalents of HCl. The normality of concentrated hydrochloric acid with a density of 1.190 is 12.50*N*, and that of diluted (1 : 1) acid is consequently 6.25*N*, i.e., 1 ml of the latter contains

6.25 mg-equiv of HCl. It follows that Na_2CO_3 is neutralized by $\frac{113.23}{6.25} =$ $= 18.12$ ml of diluted (1 : 1) hydrochloric acid. If 20 ml of the acid are added, it would not be too excessive.

These examples show how much easier it is to perform calculations when concentrations of acids and bases are expressed in their normalities. Table 18 helps convert differently expressed concentrations. The reliability of the table is so great that its data can be used when preparing titrants of acids and alkalies according to density. The titre of the prepared solution must nevertheless be checked by a weighed portion of a parent substance. Here is an example of calculation when a titrating solution is being prepared.

Example 4. To prepare $1N$ HCl titrant, an acid available in the laboratory is taken, its density determined with an areometer is equal to 1.082 g/cm³.

From Table 18,C we have: the acid with a density of 1.080 g/cm³ has a concentration of $4.878N$ and that with a density of 1.085 g/cm³, $5.192N$. By interpolation, we obtain the following normality for a density of 1.082:

$$4.878+\frac{2}{5}(5.192-4.878)=4.878+\frac{2}{5}\times 0.314=5.004$$

It follows that one volume of the available acid must be diluted to 5.004 of the volume. For this purpose, we can measure out, for example, 200 ml of the acid with a density of 1.082, pour it into a one-litre volumetric flask, dilute it with water up to the volume and add another 0.8 ml of water (1 : 5.004 = 200 : 1000.8).

Table 19

Chief Acid-Base Indicators

For volumetric-analytical titrations (acidimetry-alkalimetry methods), it is necessary to select indicators that change colour in the pH range as little as possible. Such indicators as azolitmin, which changes colour at pH values from 5.0 to 8.0, are not suitable at all for titration. Of little use are also indicators whose colours of both forms lie in a spectrum too close to one another, for example, indicators which change their colour from red to orange, from orange or orange-red to yellow, from blue-violet to blue, and so forth. In recent years, indicators which sharply change their colours to spectrally opposite ones in very narrow pH limits have been synthesized; for example, nitrazine yellow, which changes its colour from yellow to blue-violet within pH 6.0-7.0, or quinoline blue, which is colourless at pH 7.0 and violet at pH 8.0.

The main rule in selecting an indicator for volumetric-analytical determinations is that *the titration index* pT *of an indicator must be as close as possible to the* pH *of the solution at the end of titration*, i.e., *when the equivalence point is reached.* The titration index pT is the pH at which the observer can clearly see the colour change and recognize titration as complete. This is a conditional value which differs for

different persons who perform titration. If the eye could easily detect the slightest change in colour, the pT would obviously coincide with the equivalence point. But since titration is usually completed at visible colour change, it can be assumed that, with dichromatic indicators, the pT is approximately at one-quarter of an interval from its corresponding limit.* With monochromatic indicators (phenolphthalein, nitrophenols), the pT almost coincides with the beginning of the appearance of colour, provided that the indicator is used in the dilution at which its colour change was determined.

For analyses of great accuracy, it is always necessary to separately prepare a buffer solution with a pH which coincides with the pH of the equivalence point and add the indicator to it, and then titrate the solution being analysed until its colour coincides with the colour of the prepared reference solution.

When a weak acid is titrated with caustic soda, at the end of the titration a solution of sodium salt of the acid is formed which, as a result of the hydrolysis of the salt, has an alkaline reaction. Knowing the ionization constant of the acid, the pH of the solution formed can be determined and, in accordance with this pH, a suitable indicator can be selected. This is also true of acid titration of a weak base solution, when a salt is formed which has an acid reaction in the solution as a result of hydrolysis.

In hydrochloric acid titration of a salt solution of an alkali metal and weak acid (for example, Na_2CO_3), the solution will contain, at the end of the titration, neutral chloride of the alkali metal and free weak acid, consequently having an *acid reaction*. Knowing the ionization constant of this acid, we can calculate the pH of its diluted solution obtained at the end of titration and select a suitable indicator.

When a strong acid is titrated with a *strong alkali solution* (or vice versa), a solution of neutral non-hydrolyzing salt with the pH of about 7 is obtained. But there is no need to use an indicator which changes its colour at pH close to 7, since the smallest drop of the titrant sharply displaces the pH to an acid (in acid titration) or an alkaline region (in alkali titration). In such titrations, any indicator can be used; nevertheless, when titration is performed with a greatly diluted solution of acid or alkali (for example, 0.01*N*) whose drop contains a very small amount of the titrant, the indicators showing colour change in the pH range of 5 to 9 should be used.

Table 21

Colorimetric Determination of the pH of Solutions

For the colorimetric determination of the pH of solutions, indicators which change colour within a small pH range are of little use. Most useful are dichromatic indicators which, within a sufficiently large pH range, show noticeable changes in shades when the pH changes by 0.1-0.2. Use is also made of monochromatic indicators whose colour becomes, as the pH changes, more or less intense while retaining

* Some analysts believe that the pT is in the middle of the interval of the indicator colour change.

shade. In both cases, the colour is determined that the indicator assumes in the test solution and in a set of standard buffer solutions having different pH values preliminarily found by the electrometric method. The pH of the test solution is equal to the pH of the buffer solution whose colour is the closest to that of the test solution.

In the colorimetric determination of the pH, account must be taken of the following possible sources of errors which should also be considered when selecting an indicator.

(a) *Influence of foreign salts.* Let us denote the ionization constant of an indicator as K_{Ind}. Then, $K_{\text{Ind}} = \frac{a_{H^+}a_{I^-}}{a_{HI}}$, where a_{I^-} is the activity of the indicator anions formed as a result of dissociation, a_{HI} is the activity of its undissociated part. In the example, the indicator is a weak acid, and if the indicator is a base, further reasonings do not change in the main. Having replaced the activities by the products of concentrations and activity coefficients, we obtain:

$$\frac{[HI]f_0}{[I^-]f_1} = \frac{a_{H^+}}{K_{\text{Ind}}}$$

where f_0 is the activity coefficient of the coloured or colourless undissociated part of the indicator; f_1 is the activity coefficient of the coloured anion; the corresponding concentrations are in square brackets.

The colour of the solution depends on the ratio $\frac{[HI]}{[I^-]}$, and therefore the solutions having the same ratio will have the same colour. But will the solutions having the same ratio $\frac{[HI]}{[I^-]}$ have the same pH? Let us present the above expression in the following form:

$$\frac{[HI]}{[I^-]} = \frac{a_{H^+}f_1}{K_{\text{Ind}}f_0}$$

If the solutions have different ionic strength, the values of f_1 will also differ (and, to a very small extent, those of f_0, which can be neglected). With increasing ionic strength of a solution, the activity coefficients of ions decrease and, consequently, so does f_1. When the colour of the solution does not change, i.e., it has the same ratio $\frac{[HI]}{[I^-]}$, the value of a_{H^+} must accordingly be greater: the solution will yield the same colour with the indicator, being more acidic. Conversely, with decreasing ionic strength, f_1 increases, and a_{H^+} must accordingly be less when the solution has the same colour. The pH value of buffer solutions is determined electrometrically usually at the ionic strength of 0.1. If the ionic strength of a solution being analysed is greater than 0.1 (owing to the presence of a large amount of salts), the solution will have the colour which corresponds to that of the buffer solution with higher hydrogen-ion concentration (lower pH). Consequently, it is necessary to make a correction which has a negative value in this case. If the ionic strength of a solution being

analysed is less than 0.1 (the solution contains a small amount of salts), then with the same colour that the indicator has in the buffer solution, the solution will be less acidic (higher pH) and the correction will have a positive sign. This correction is called *salt correction*. It should be noted that this correction depends *not only* on the ionic strength of a solution, but also on individual properties of the indicator and the nature of ions that are present. If use is made of the indicators whose acidic form is a single-charge anion and whose alkaline form is a double-charge anion (phenolphthalein, sulphophthaleins), the correction will be greater than when use is made of the indicators whose acidic form is an undissociated molecule and its alkaline form is a single-charge anion (mononitrophenols). Dimethylaminoazobenzene-sulphonic acid (methyl orange) and dimethylaminoazobenzene-*o*-carboxylic acid (methyl red) cause a very small salt error owing to their amphoteric nature, and therefore they are mainly used in determining the pH of solutions having a variable content of salts. If the ionic strength of a solution is greater than 0.1, the correction value is considerably influenced by the nature of salt ions (the size of ion radii) in a solution.

(b) *Influence of the buffer capacity of a solution.* Indicators used to determine the pH of solutions are themselves acids or bases, and if the solution being analysed has low buffer capacity (distilled water, solutions of neutral salts in distilled water, solutions of very weak acids or bases, etc.), the indicator can sharply change its pH. If, for example, 0.1 ml of 0.04% methyl red solution is added to 10 ml of distilled water (pH 7), then even this small quantity of the indicator ($K_{Ind} = 1 \times 10^{-5}$) will change the pH of the water from 7.0 to 5.0.

In determining the pH of such low buffer capacity solutions, their pH will not change if we add to the solution being analysed the indicator solution having the same pH. According to Fausette and Acri,* such solutions of indicators are called *isohydric*. It has been proved that the pH of a solution of low buffer capacity does not change even if *any* amount of an isohydric solution of an indicator is added to it. This underlies the method of determining the pH of such solutions. A set of solutions of an indicator having different pH values is prepared and the solution being analysed is added to every one of them. The indicator solution that does not change its colour is isohydric relative to the solution being analysed.

(c) *Protein error*. A number of proteins greatly affect indicators, making the determination of the pH in their presence impossible. The influence of proteins is specific and depends on the nature of the protein and of the indicator. Therefore, in the presence of proteins, the results of the colorimetric determination of the pH cannot be relied on, having to be verified by the electrometric method.

(d) *Other sources of errors*. In the presence of colloids and sometimes of coarser dispersed particles, an indicator can change colour as a result of one of its forms ("acidic" or "alkaline") being sorbed on the surface of particles. The ionization constant of an indicator changes also at the air-liquid interface. This explains the frequently observed phenomenon when, in shaking a solution of an indicator, the colour

* Ind. Eng. Chem., An. Ed., 2,78 (1930).

of the foam being formed sharply differs from the colour of the solution. When the solution contains finely-dispersed particles of another phase, the result of the determination of the pH must be verified by using two different indicators (acidic and basic) or comparing them with the results of the electrometric determination.

Indicators sharply change colour at pH constant if a non-aqueous solvent—alcohol, acetone, etc.—is added to a solution, and also when the temperature changes.

Table 40

Standard Oxidizing Potentials Relative to the Potential of a Standard Hydrogen Electrode at 25 °C

If a plate of noble metal is immersed in a solution which contains an oxidizing agent and the product of its reduction, there will be a difference of potentials between the plate and the solution, which is called the *oxidizing potential of a given system.*

1. For the system

$$\text{oxidizing agent} + ne \rightleftarrows \text{reducing agent}$$

the oxidizing potential relative to the standard hydrogen potential is expressed by the formula

$$E = E^0 + \frac{RT}{nF} \ln \frac{a_{\mathrm{Ox}}}{a_{\mathrm{Red}}}$$

(where R = gas constant, T = absolute temperature of a solution, n = number of electrons which in the given system make the transition from a reducing agent to an oxidizing agent, F = faraday constant = 96,500 coulombs, a_{Ox} and a_{Red} = ion activities of oxidizing and reducing agents in a solution). Having replaced natural logarithms with common logarithms and having substituted all values of constants in the equation, we obtain for t = 25 °C:

$$E = E^0 + \frac{0.0591}{n} \log \frac{a_{\mathrm{Ox}}}{a_{\mathrm{Red}}}$$

If $a_{\mathrm{Ox}} = a_{\mathrm{Red}}$, then $E = E^0$. The standard potential is the potential of the electrode immersed in a solution which contains both forms (oxidized and reduced) *having equal activities.*

2. If an oxidizing agent is reduced with the participation of hydrogen ions

$$\mathrm{Ox} + m\mathrm{H}^+ + ne = \mathrm{Red} + q\mathrm{H_2O}$$

then

$$E = E^0 + \frac{RT}{nF} \ln \frac{a_{\mathrm{Ox}} a^m_{\mathrm{H}^+}}{a_{\mathrm{Red}}}$$

In this case, the standard potential is the potential of the electrode immersed in a solution containing both forms (oxidized and reduced) *having equal activities*, and also, hydrogen ions *whose activity is equal*

to unity. This applies, for example, to such systems as

$$MnO_4^- + 8H^+ + 5e \rightleftharpoons Mn^{2+} + 4H_2O$$

or

$$VO_3^- + 4H^+ + e \rightleftharpoons VO^{2+} + 2H_2O$$

3. When the potential between the metal and the solution of its salt is being determined, i.e., of the systems $Me^{n+} + ne \rightleftharpoons Me$ (for example, $Zn^{2+} + 2e \rightleftharpoons Zn$), and the activity of the solid phase is taken as unity, then

$$E = E^0 + \frac{RT}{nF} \ln a_{Me^{n+}}$$

In this case, $E = E^0$, when $a_{Me^{n+}} = 1$. Here, the standard potential is the potential between the metal and the solution of its salt, when the activity of the metal ions equals unity.

4. When one or the two forms (oxidized and reduced) are sparingly soluble solids or complex compounds, the number of ions formed in the solution will be very insignificant. Let us take, for example, the system

$$AgCl + e \rightleftharpoons Ag + Cl^-$$

For it

$$E_{Ag^+,\,Ag} = E^0_{Ag^+,\,Ag} + \frac{RT}{F} \ln a_{Ag^+}$$

The value of a_{Ag^+}, the activity of silver ions in the solution, is very small and depends on the solubility product of silver chloride SP_{AgCl} and on the activity of chloride-ions in the solution:

$$a_{Ag^+} = SP_{AgCl}/a_{Cl^-}$$

If the activity of chloride ions equals unity, the right-hand part of the equation for the potential will assume the form:

$$E^0_{Ag^+,\,Ag} + \frac{RT}{F} \ln SP_{AgCl} = E^{0'}_{AgCl,\,Ag}$$

The quantity $E^{0'}_{AgCl,\,Ag}$ is called the *standard* ("observed") *potential* of AgCl/Ag system. It can be defined as the potential which is formed in the system containing solids or complex compounds in which all ions participating in the process, except *elementary ions that are separated by precipitates or complexes*, have an activity equal to unity.

The aforementioned equation can be used to calculate the solubility products of sparingly soluble substances by the measured values of the oxidizing potentials.

Here is another example of the formation of a complex compound. For the system

$$Ag(CN)_2^- + e \rightleftharpoons Ag + 2CN^-$$

we also have

$$E_{Ag^+,\,Ag} = E^0_{Ag^+,\,Ag} + \frac{RT}{F} \ln a_{Ag^+}$$

The value of a_{Ag^+} depends on the stability of the complex $Ag(CN)_2^-$ and is determined by the dissociation constant $K_{Ag(CN)_2^-} = \frac{a_{Ag^+}a^2_{CN^-}}{a_{Ag(CN)_2^-}}$. If the solution being examined contains free ions CN^- and complex ions $Ag(CN)_2^-$ in concentrations whereby their activities equal unity, then

$$K_{Ag(CN)_2^-} = a_{Ag^+}$$

and

$$E^0_{Ag^+, Ag} + \frac{RT}{F} \ln K_{Ag(CN)_2^-} = E^{0'}_{Ag(CN)_2^-, Ag}$$

Similar formulas are used to find the dissociation constants of complexes by the data of potentiometric determinations. The table gives several such standard ("observed") *potentials of the systems containing precipitates and soluble complex compounds.*

5. *If, in the aforementioned oxidation-reduction system, one of the forms is a gaseous substance, the activity of this substance will be determined by gas pressure*, and the standard potential of the gas electrode can be defined as the potential of the electrode in which this gas is under a pressure of 1 atm; the ions which are formed when this gas is reduced (or oxidized) have an activity of unity in the solution.

The equation of the potential $E = E^0 + \frac{RT}{nF} \ln \frac{a_{Ox}}{a_{Red}}$ includes ion *activities* of oxidized and reduced forms, and not concentrations. It follows that, when the concentrations of ions of both forms are the same, the values of potentials in two solutions can nevertheless differ if the salt composition of these solutions and the ionic strength related to it are different. The potential of, say, the system $Ce^{4+} + e \rightleftarrows Ce^{3+}$ is

$$E_{Ce^{4+}, Ce^{3+}} = E^0_{Ce^{4+}, Ce^{3+}} + \frac{RT}{F} \ln \frac{a_{Ce^{4+}}}{a_{Ce^{3+}}} =$$

$$= E^0_{Ce^{4+}, Ce^{3+}} + \frac{RT}{F} \ln \frac{[Ce^{4+}]}{[Ce^{3+}]} \frac{f_4}{f_3}$$

where f_4 and f_3 are the activity coefficients of four- and three-charge Ce ions. As the ionic strength of a solution increases, f_4 will decrease considerably faster than f_3 and, consequently, the value of E will drop. This must always be borne in mind when using oxidation potentials in calculations and reasonings connected with various problems of analytical chemistry, where solutions with a high ionic strength are usually used.

The table gives the potentials of various elements having different valence; the potentials of the direct transition from the highest valence to the lowest one (for example, V^V-V^{II}), and several potentials of the stage-by-stage transition (for example, V^V-V^{IV}; V^{IV}-V^{III}; V^{III}-V^{II}). These potentials are interconnected by the so-called *Luther rule*

which states that if an element exists in three degrees of valence m, n and p, and $m > n > p$, then:

$$(m-p)\,E^0_{m,\,p} = (m-n)\,E^0_{m,\,n} + (n-p)\,E^0_{n,\,p}$$

where $E^0_{m,\,p}$, $E^0_{m,\,n}$ and $E^0_{n,\,p}$ are the standard potentials of transitions from valence m to valence p, from m to n and from n to p. For example, Fe exists in the form of ions Fe^{3+} (valence of 3) and Fe^{2+} (valence of 2), and in the form of metal (valence of 0). According to Luther's rule

$$3E^0_{Fe^{3+},\,Fe} = E^0_{Fe^{3+},\,Fe^{2+}} + 2E^0_{Fe^{2+},\,Fe}$$

A number of potentials which are very difficult or even impossible to determine experimentally were calculated by Luther's formula.
